

Hard Core Predicate

601.642/442: Modern Cryptography

Fall 2017

- Proof via Reduction: f_x is a weak OWF
- Amplification: From weak to strong OWFs

Today - Part I

- What do OWFs Hide?
- Hard Core Predicate
- Concluding Remarks on OWFs

What OWFs Hide

- The concept of OWFs is simple and concise
- But OWFs often not very useful by themselves
- It only guarantees that $f(x)$ hides x but nothing more!
 - E.g., it may not hide first bit of x ,
 - Or even first half bits of x
 - Or ANY subset of bits
- In fact: if $\mathbf{a}(x)$ is any non-trivial information about x , we don't know if $f(x)$ will hide it (except when $\mathbf{a}(x) = x$)

Is there any non-trivial (non-identity) function of x , even 1 bit, that OWFs hide?

Hard Core Predicate

- A **hard core predicate** for a OWF f
 - is a function over its inputs $\{x\}$
 - its output is a single bit (called “hard core bit”)
 - it can be easily computed given x
 - but “hard to compute” given only $f(x)$
- Intuition: f may leak many bits of x but it does not leak the hard-core bit.
- In other words, learning the hardcore bit of x , even given $f(x)$, is “as hard as” inverting f itself.
- Think: What does “hard to compute” mean for a single bit?
 - you can always guess the bit with probability $1/2$.

Hard Core Predicate: Definition

- Hard-core bit cannot be learned or “predicted” or “computed” with probability $> \frac{1}{2} + \nu(|x|)$ even given $f(x)$ (where ν is a negligible function)

Definition (Hard Core Predicate)

A predicate $h : \{0, 1\}^* \rightarrow \{0, 1\}$ is a hard-core predicate for $f(\cdot)$ if h is efficiently computable given x and there exists a negligible function ν s.t. for every non-uniform PPT adversary \mathcal{A} and $\forall n \in \mathbb{N}$:

$$\Pr \left[x \leftarrow \{0, 1\}^n : \mathcal{A}(1^n, f(x)) = h(x) \right] \leq \frac{1}{2} + \nu(n).$$

Hard Core Predicate: Construction

- Can we construct hard-core predicates for general OWFs f ?
- Define $\langle x, r \rangle$ to be the **inner product** function mod 2. I.e.,

$$\langle x, r \rangle = \left(\sum_i x_i r_i \right) \pmod 2$$

Theorem (Goldreich-Levin)

Let f be a OWF (OWP). Define function

$$g(x, r) = (f(x), r)$$

where $|x| = |r|$. Then g is a OWF (OWP) and

$$h(x, r) = \langle x, r \rangle$$

is a hard-core predicate for f

Proof?

- Proof via Reduction?
- **Main challenge:** Adversary \mathcal{A} for h only outputs 1 bit. Need to build an inverter \mathcal{B} for f that outputs n bits.

Warmup Proof (1)

- Assumption: Given $g(x, r) = (f(x), r)$, adversary \mathcal{A} *always* (i.e., with probability 1) outputs $h(x, r)$ correctly
- Inverter \mathcal{B} :
 - Compute $x_i^* \leftarrow \mathcal{A}(f(x), e_i)$ for every $i \in [n]$ where:

$$e_i = (\underbrace{0, \dots, 0}_{(i-1)\text{-times}}, 1, \dots, 0)$$

- Output $x^* = x_1^* \dots x_n^*$

Warmup Proof (2)

- **Assumption:** Given $g(x, r) = (f(x), r)$, adversary \mathcal{A} outputs $h(x, r)$ with probability $3/4 + \varepsilon(n)$ (over choices of (x, r))
- **Main Problem:** Adversary may not work on “improper” inputs (e.g., $r = e_i$ as in previous case)
- **Main Idea:** Split each query into two queries s.t. each query individually looks random
- Inverter \mathcal{B} :
 - Let $a := \mathcal{A}(f(x), e_i + r)$ and $b := \mathcal{A}(f(x), r)$, for $r \xleftarrow{\$} \{0, 1\}^n$
 - Compute $c := a \oplus b$
 - $c = x_i$ with probability $\frac{1}{2} + \varepsilon$ (Union Bound)
 - Repeat and take majority to obtain x_i^* s.t. $x_i^* = x_i$ with prob. $1 - \text{negl}(n)$
 - Output $x^* = x_1^* \dots x_n^*$

Try on your own

Try on your own (or read from lecture notes)

- Goldreich-Levin Theorem extremely influential even outside cryptography
- Applications to learning, list-decoding codes, extractors,...
- Extremely useful tool to add to your toolkit

Final Remarks

- One-way functions are necessary for most of cryptography
- But often not sufficient. *Black-box* separations known [Impagliazzo-Rudich'89]; **full separations not known**
- Additional Reading: Universal One-way Functions
 - Suppose somebody tells you that OWFs exist! E.g., they might discover a proof for it!
 - But they don't tell you what this function is. E.g., even they might not know the function! They just have a proof of its existence...
 - Can you use this fact to build an **explicit** OWF?
 - Yes! Levin gives us a method!
