# Groups

- A group  $G$  is defined by a set of elements and an operation which maps two elements in the set to a third element
- $(G, \bullet)$  is a group if it satisfies the following conditions:
  - Closure: For all  $a, b \in G$ , we have  $a \bullet b \in G$
  - Associativity: For all  $a, b, c \in G$ , we have  $(a \bullet b) \bullet c = a \bullet (b \bullet c)$
  - Identity: There exists an element  $e$  such that for all  $a \in G$ , we have  $e \bullet a = a$
  - Inverse: For every  $a \in G$ , there exists  $b \in G$  such that  $a \bullet b = e$
- Think: Is  $a \bullet b$  always equal to  $b \bullet a$ ?
  - Read: Abelian Groups
- Think: Can there be different left and right identity elements?
- Think: Can there be different left and right inverses?
- Example:  $(\mathbb{Z}, +)$
- Read: (Example) Symmetry Group

# Cyclic Groups

- A group  $(G, \cdot)$  is a cyclic group if it is generated by a single element
- That is:  $G = \{1 = e = g^0, g^1, \dots, g^{n-1}\}$ , where  $|G| = n$
- Written as:  $G = \langle g \rangle$
- Order of  $G$ :  $n$

# Discrete Logarithm Problem

- Let  $(G, \cdot)$  be a cyclic group of order  $p$  with generator  $g$ , where  $p$  is an  $n$ -bit prime number.
- Given  $(g, b = g^a)$ , where  $a \xleftarrow{\$} \{0, \dots, p - 1\}$ , it is hard to predict  $a$

# Discrete Logarithm Problem: Definition

## Definition (Discrete Logarithm Problem)

Let  $(G, \cdot)$  be a cyclic group of prime order  $p$  with generator  $g$ , then for every non-uniform PPT adversary  $\mathcal{A}$ , there exists a negligible function  $\varepsilon$  such that

$$\Pr[a \stackrel{\$}{\leftarrow} \{0, \dots, p-1\}, a' \leftarrow \mathcal{A}(G, p, g, g^a) : a = a'] \leq \varepsilon$$

# Computational Diffie-Hellman Assumption

- Let  $G$  be a cyclic group  $(G, \cdot)$  of order  $p$  with generator  $g$ , where  $p$  is an  $n$ -bit prime number.
- Give  $(g, g^a, g^b)$  to the adversary
- Hard to find  $g^{ab}$

# Computational Diffie-Hellman Assumption: Definition

## Definition (Computational Diffie-Hellman Assumption)

Let  $(G, \cdot)$  be a cyclic group of prime order  $p$  with generator  $g$ , then for every non-uniform PPT adversary  $\mathcal{A}$ , there exists a negligible function  $\varepsilon$  such that

$$\Pr[a, b \stackrel{\$}{\leftarrow} \{0, \dots, p-1\}, y \leftarrow \mathcal{A}(G, p, g, g^a, g^b) : g^{ab} = y] \leq \varepsilon$$

# Decisional Diffie-Hellman Assumption

- Let  $(G, \cdot)$  be a cyclic group of order  $p$  with generator  $g$ , where  $p$  is an  $n$ -bit prime number.
- Pick  $b \xleftarrow{\$} \{0, 1\}$
- If  $b = 0$ , send  $(g, g^a, g^b, g^{ab})$ , where  $a, b \xleftarrow{\$} \{0, \dots, p-1\}$
- If  $b = 1$ , send  $(g, g^a, g^b, g^r)$ , where  $a, b, r \xleftarrow{\$} \{0, \dots, p-1\}$
- Adversary has to guess  $b$
- Effectively:  $(g, g^a, g^b, g^{ab}) \approx (g, g^a, g^b, g^r)$ , for  $a, b, r \xleftarrow{\$} \{0, \dots, p-1\}$  and any  $g$

# Decisional Diffie-Hellman Assumption: Definition

## Definition (Decisional Diffie-Hellman Assumption)

Let  $(G, \cdot)$  be a cyclic group of prime order  $p$  with generator  $g$ , then the following two distributions are indistinguishable:

- $\{a, b \stackrel{\$}{\leftarrow} \{0, \dots, p-1\} : (G, p, g, g^a, g^b, g^{ab})\}$
- $\{a, b, r \stackrel{\$}{\leftarrow} \{0, \dots, p-1\} : (G, p, g, g^a, g^b, g^r)\}$

# Relationship

$$\text{DDH} \implies \text{CDH} \implies \text{DL}$$

# Key Agreement

- Alice and Bob want to share a key.
- They want to establish a shared key by sending each other messages over a channel.
- However, there is an adversary (Eavesdropper) that is eavesdropping on this channel and sees the messages that are sent over it.
- How to securely establish a shared key while keeping it hidden from the eavesdropper?

## Key Agreement: Definition

- Alice picks a local randomness  $r_A$
- Bob picks a local randomness  $r_B$
- Alice and Bob engage in a protocol and generate the transcript  $\tau$
- Alice's view  $V_A = (r_A, \tau)$  and Bob's view  $V_B = (r_B, \tau)$
- Eavesdropper's view  $V_E = \tau$
- Alice outputs  $k_A$  as a function of  $V_A$  and Bob outputs  $k_B$  as a function of  $V_B$
- Correctness:  $\Pr_{r_A, r_B}[k_A = k_B] \approx 1$
- Security:  $(k_A, V_E) \equiv (k_B, V_E) \approx (r, \tau)$

## Key Agreement: Construction (Diffie-Hellman)

- Let  $(G, \cdot)$  be a cyclic group of order  $p$  with generator  $g$ , where  $p$  is an  $n$ -bit prime number.
- Alice picks  $a \xleftarrow{\$} \{0, \dots, p-1\}$  and sends  $g^a$  to Bob
- Bob picks  $b \xleftarrow{\$} \{0, \dots, p-1\}$  and sends  $g^b$  to Alice
- Alice outputs  $(g^b)^a$  and Bob outputs  $(g^a)^b$
- Adversary sees:  $(g^a, g^b)$
- Correctness?
- Security? Use DDH to say that  $g^{ab}$  is perfectly hidden from it
- Think: Is this scheme still secure if the adversary is allowed to modify the messages?
