

Rendering Software Acceleration

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

The Need for Acceleration

Constructing detailed models becoming easy

- **Re-use models from a “catalog”**
- **High tessellation for smooth appearance up close**

Stereo, anti-aliasing, high resolution all reduce raw performance

Software management required for detailed models and complex environments

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Stages to Accelerate

**Client-server
communications**

**Per-primitive
operations**

**Per-pixel
operations**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Acceleration Types

Fast path for machine/API

- **Triangle strips/fans, vertex arrays, display lists**

Culling Techniques

- **View frustum, backface, cell/portal, general occlusion**

Replacement Techniques

- **Levels of detail, portal textures, general image replacement**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Fast Path for Machine/API

**Principle: know your architecture
and use the methods optimized
for speed by the designers
whenever possible.**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Fast API primitives

Triangle strips/fans

- **Reduce triangles from 3 vertices to 1 in limit**
- **Reduces communications and per-vertex operations (transformation, lighting)**

Vertex arrays

- **Pack vertex coordinates and properties into arrays**
 - **Avoids communications overhead of individual commands**
-

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Display Lists

Cache large sets of commands to be reused

If available, store at server side

- **Saves on communications if it fits in cache**

Potential for optimization

- **concatenate matrices**
- **format data for processing**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Culling Techniques

Principle: Do not render those primitives that will not ultimately be visible to the user.

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

View Frustum Culling Diagram

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

View Frustum Culling

Do not render primitives that lie outside viewing frustum

May be determined exactly or conservatively

May or may not consider near and far planes

May be performed hierarchically

- **Cluster primitives**
- **Cull bounding volumes of entire clusters**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Database Hierarchy

Leaf nodes may have one or more primitives
Culling traversal may go down to leaves or terminate early
Bounding volumes used to cull-test an entire node

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Backface Culling Diagram

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Backface Culling Basics

Don't render primitives facing away from the viewer

- For solid objects, front occludes back

Polygon is backfacing iff ray from polygon to eye is more than 90° from polygon normal

Orthogonal Projection

- Test sign of $(-\text{viewdir} \cdot \text{normal})$

Perspective Projection

- Test sign of $(\text{eye-polygon} \cdot \text{normal})$
-

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Edge-on Polygons in Perspective

Critical angle between front- and back-facing

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

90 Degrees from View Direction

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Options

In graphics engine

- **After client-server communications**
- **Often after transformation - eye or screen space**

On client

- **In object space**
- **Avoids communication and transformation**

May be performed hierarchically

- **Restricts cluster organization of hierarchy**

May be accelerated with normal masks

- **Quantize normals, classify quantizations**
- **Conservative backface culling on client**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

1997 Symposium on Interactive 3D Graphics

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Tradeoffs

Culling at client end

- **Reduces bandwidth requirements**
- **Adds conditional to tight rendering loop**
- **May be difficult with triangle strips**

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Cell and Portal Culling

Cells associated with rooms

Portals associated with windows and doors

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Cell and Portal Basics

Partition model into cells with portals between them

Reduce model to *potentially visible set*

- Primitives in current cell and cells visible through portals

Hierarchy of viewing frusta

- Each portal narrows the viewing frustum into adjacent cells

Useful for models with wall-like occlusions

- Difficult to determine structure automatically

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Cell and Portal Video

“Portals and Mirrors: Simple, Fast Evaluation of Potentially Visible Sets”

Occlusion Culling Diagram

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Occlusion Culling Basics

Don't render occluded primitives

- Expensive to compute exactly

Algorithm components

- Occluder selection
- Occlusion test

Object-space approach

- Shadow frusta

Image-space approach

- Hierarchical occlusion maps

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Occluder Selection

Prune database to potentially good occluders

Preprocessing: create occluder database

- Retain large, simple objects
- Discard small objects
- Discard or replace complex objects

Run-time processing: view-dependent criteria

- Distance from viewpoint
- Size
- Temporal coherence

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Shadow Frustum Diagram

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Shadow Frustum Approach

Construct frustum for current occluders

Perform hierarchical frustum cull for each

- **Database nodes fully contained in a frustum are occluded**

Easily implemented using same code as view frustum culling

Not so good for *occluder fusion*

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Occlusion Maps

Render occluders into highest resolution map

- Covered pixels get opacity of 1

Filter maps by averaging

- For higher resolutions, accelerate with texture map hardware

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen

Culling with Occlusion Maps

Culling requires depth + map coverage

Depth

- only cull primitives farther than farthest occluder

Coverage

- Compute bounding screen-space rectangle for database node
- Cull all map pixels in rectangle (at some resolution) are above opacity threshold

Johns Hopkins Department of Computer Science
Course 600.460: Virtual Worlds, Spring 2000, Professor: Jonathan Cohen
