Barycentric Coordinates of Deforming Triangle

$$\vec{c} = \zeta \vec{m}_s + \xi \vec{m}_t + \psi \vec{m}_u$$

Barycentric Coordinates of Deforming Triangle

$$\vec{m}_s = \vec{m}_{0,s} + \sum_{m=1}^{N_{\text{modes}}} \lambda_m^{(t)} \vec{m}_{m,s}$$

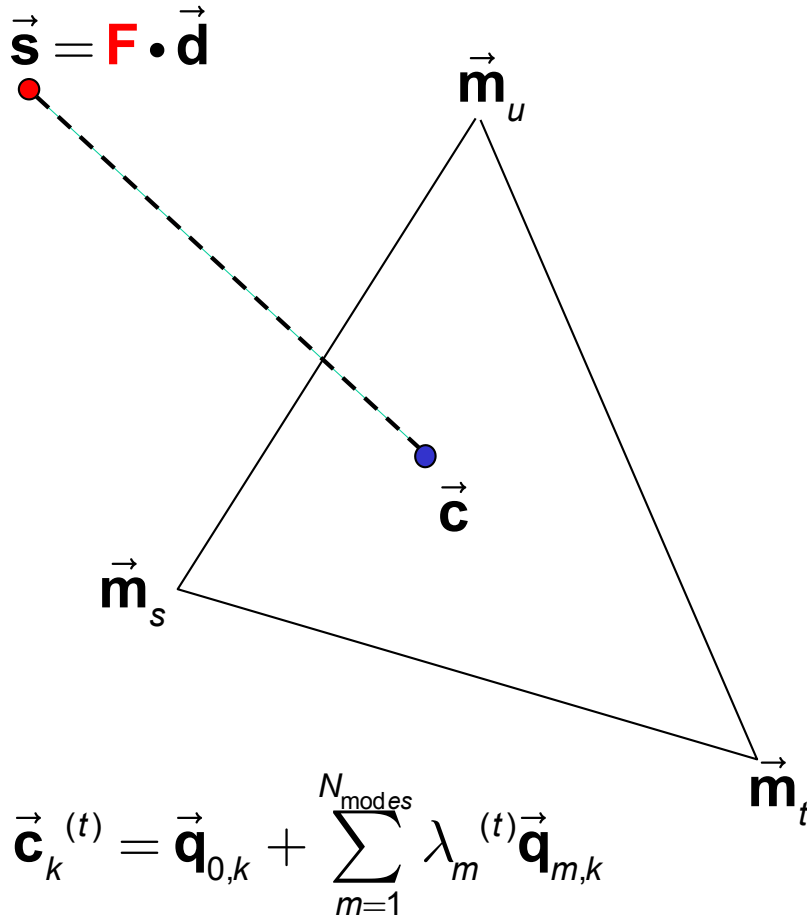

$$\vec{m}_t = \vec{m}_{0,t} + \sum_{m=1}^{N_{\text{modes}}} \lambda_m^{(t)} \vec{m}_{m,t}$$

$$\vec{m}_u = \vec{m}_{0,u} + \sum_{m=1}^{N_{\text{modes}}} \lambda_m^{(t)} \vec{m}_{m,u}$$

$$\vec{q}_{m,k} = \zeta_k \vec{m}_{m,s} + \xi_k \vec{m}_{m,t} + \psi_k \vec{m}_{m,u}$$

$$\vec{c}_k^{(t)} = \vec{q}_{0,k} + \sum_{m=1}^{N_{\text{modes}}} \lambda_m^{(t)} \vec{q}_{m,k}$$

Deformable Registration to SSM

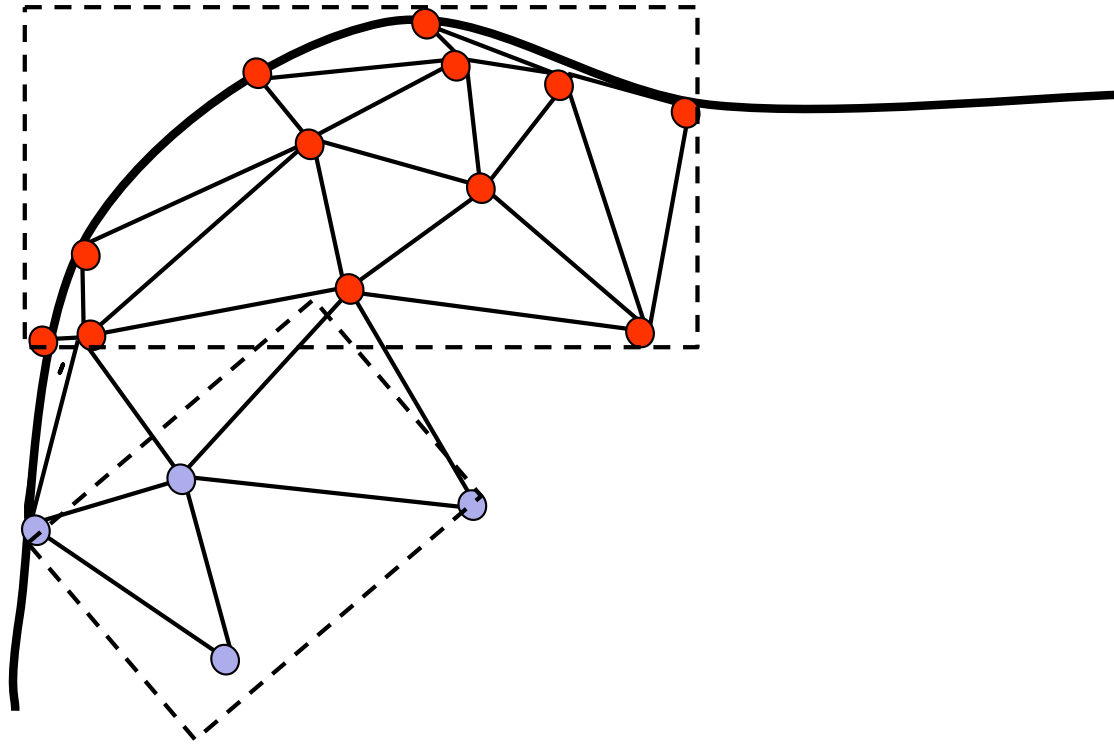

Step 1 For sample points, find closest matches to current mesh

Step 2 Solve $\mathbf{F} \cdot \vec{d}_k \approx \vec{q}_{0,k} + \sum_{m=1}^{N_{\text{modes}}} \lambda_m^{(t)} \vec{q}_{m,k}$
for \mathbf{F} and/or $\lambda_m^{(t)}$

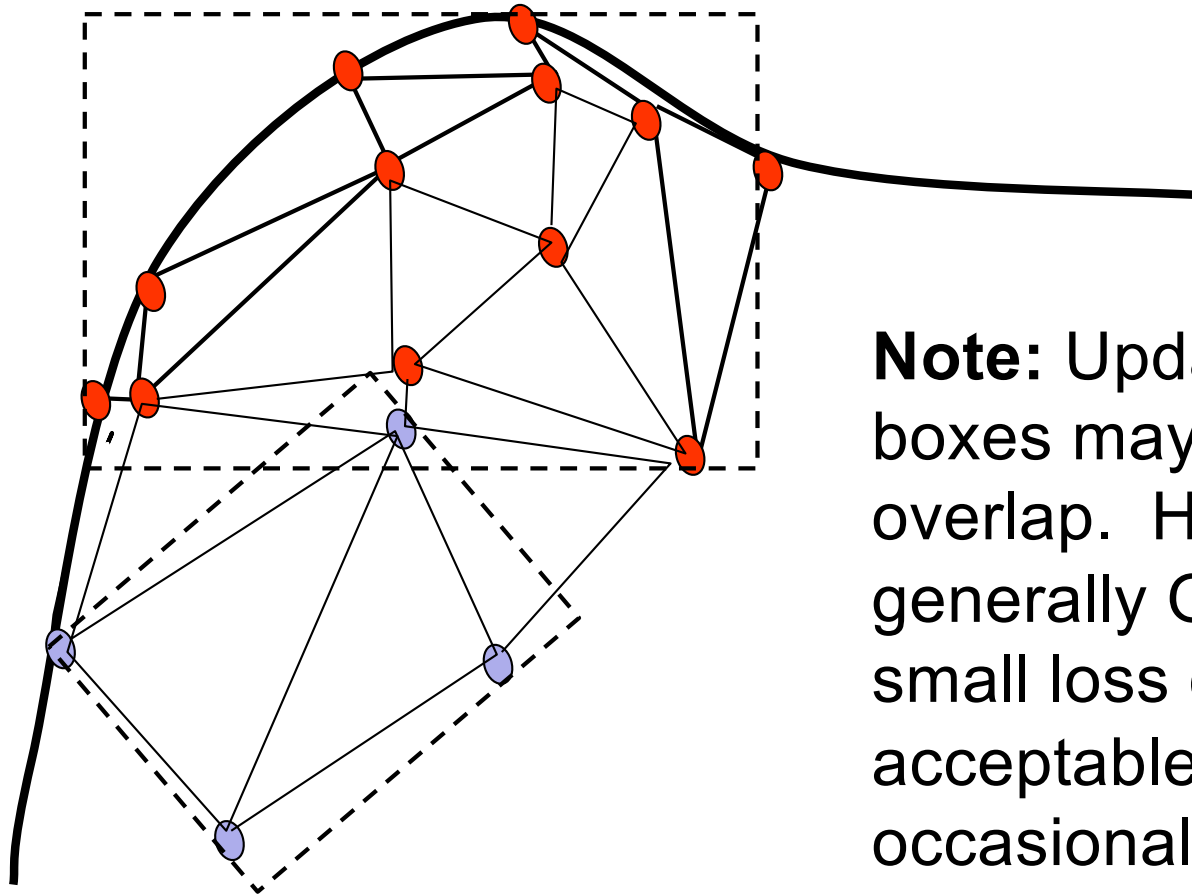

Step 3 If change the shape parameters then update bounding boxes

Step 4 Iterate to convergence

Updating Bounding Boxes

Updating Bounding Boxes

Note: Updated bounding boxes may increase overlap. However, this is generally OK, since some small loss of efficiency is acceptable. You can occasionally rebuild the whole tree if it becomes an issue.
