#### **N-linear Interpolation**

Let

$$\overline{\Lambda}_N = \{\lambda_1, \dots, \lambda_N\}, \text{ with } 0 \le \lambda_k \le 1$$

be a set of interpolation parameters, and let

$$\overline{\mathbf{A}} = \left\{ A_1, \dots, A_{2^N} \right\}$$

be a set of constants. Then we define:

NlinearInterpolate( $\Lambda_N$ , **A**) =

$$(1 - \lambda_N)$$
NlinearInterpolate $(\Lambda_{N-1}, \{A_1, ..., A_{2^{N-1}}\})$   
+  $\lambda_N$  NlinearInterpolate $(\Lambda_{N-1}, \{A_{2^{N-1}+1}, ..., A_{2^N}\})$ 

NOTE: Sometimes in this situation we will use notation

$$A(\overline{\Lambda}_N) = A(\lambda_1, ..., \lambda_N)$$
  
= NlinearInterpolate( $\overline{\Lambda}_N, \overline{\mathbf{A}}$ )

#### 1-D Interpolation

Given set of known values  $\{y_0(v_0),...,y_m(v_m)\}$ , find an approximating polynomial  $y \cong P(c_0,...,c_N;v)$ 

$$P(c_0,...,c_N;v) = \sum_{k=0}^{N} c_k P_{N,k}(v)$$

Note that many forms of polynomial may be used for the  $P_{N,k}(v)$ . One common (not very good) choice is the power basis:

$$P_{N,k}(v) = v^k$$

Better choices are the Bernstein polynomials and the B-spline basis functions, which we will discuss in a moment

17 600.445 Fall 2000; Updated: 1 October 2019

Engineering Research Center for Computer Integrated Surgical Systems and Technology

17

#### 1-D Interpolation

Given set of known values  $\{y_0(v_0),...,y_m(v_m)\}$ , find an approximating polynomial  $y \cong P(c_0,...,c_N;v)$ 

$$P(c_0,...,c_N;v) = \sum_{k=0}^{N} c_k P_{N,k}(v)$$

To do this, solve:

$$\begin{bmatrix}
P_{N,0}(v_0) & \cdots & P_{N,N}(v_0) \\
\vdots & \ddots & \vdots \\
P_{N,0}(v_m) & \cdots & P_{N,N}(v_m)
\end{bmatrix}
\begin{bmatrix}
c_0 \\
\vdots \\
c_N
\end{bmatrix}
\approx
\begin{bmatrix}
y_0 \\
\vdots \\
y_m
\end{bmatrix}$$

Engineering Research Center for Computer Integrated Surgical Systems and Technology

#### **Bezier Curves**

Suppose that the coefficients  $\overrightarrow{c_j}$  are multi-dimensional vectors (e.g., 2D or 3D points). Then the polynomial

$$P\left(\overrightarrow{c_0},...,\overrightarrow{c_N};v\right) = \sum_{k=0}^{N} \overrightarrow{c_k} B_{N,k}(v)$$

computed over the range  $0 \le v \le 1$  generates a Bezier curve with control vertices  $\overrightarrow{c_i}$ .

21

#### Bezier Curves: de Casteljau Algorithm

Given coefficients  $\overrightarrow{c_j}$ , Bezier curves can be generated recursively by repeated linear interpolation:

$$P(\overrightarrow{c_0},...,\overrightarrow{c_N};v)=b_0^N$$

where

$$b_{j}^{0} = \vec{c}_{j}$$

$$b_{j}^{k} = (1-v)b_{j}^{k-1} + vb_{j+1}^{k-1}$$

$$\vec{c}_{1}$$

$$v = (1-v) \vec{c}_{2}$$

$$v = (1-v) \vec{c}_{2}$$

Engineering Research Center for Computer Integrated Surgical Systems and Technology

# **B-splines**

Given

coefficient values  $\overline{\mathbf{C}} = \{\vec{c}_0, \cdots, \vec{c}_{L+D-1}\}$ 

"knot points"  $\overline{\mathbf{u}} = \{u_0, \dots, u_{L+2D-2}\}$  with  $u_i \le u_{i+1}$ 

D = "degree" of desired B-spline

Can define an interpolated curve  $P(\overline{\mathbf{C}}, \overline{\mathbf{u}}; \ u)$  on  $u_{D-1} \leq u < u_{L+D-1}$ 

Then

$$P(\overline{\mathbf{C}};u) = \sum_{j=0}^{L+D-1} \overline{c}_j \ N_j^D(u)$$

where  $N_{j}^{D}(u)$  are B-spline basis polynomials (discussed later)

27

# **B-Spline Polynomials**

For a B-spline polynomial

$$P(\overline{\mathbf{C}}, \overline{\mathbf{u}}; t) = \sum_{j=0}^{L+D-1} \overline{\mathbf{c}}_j \ N_j^D(\overline{\mathbf{u}}, t)$$

the basis functions  $N_j^D(\bar{\mathbf{u}},t)$  are a function of the degree of the polynomial and the vector  $\bar{\mathbf{u}} = \begin{bmatrix} u_0, \cdots, u_n \end{bmatrix}$  of "knot points". The polynomial is "uniform" if the distance between knot points is evenly spaced and "non-uniform" otherwise.

#### 2D Interpolation (tensor form)

Consider the 2D polynomial

$$P(u,v) = \sum_{i=0}^{m} \sum_{j=0}^{n} c_{ij} A_i(u) B_j(v)$$

$$= [A_0(u), \dots, A_m(u)] \begin{bmatrix} c_{00} & \dots & c_{0n} \\ \vdots & \ddots & \vdots \\ c_{m0} & \dots & c_{mn} \end{bmatrix} \begin{bmatrix} B_0(v) \\ \vdots \\ B_n(v) \end{bmatrix}$$

where  $A_i(u)$  and  $B_j(v)$  can be arbitrary

functions (good choices Bernstein polynomials or B-Spline basis functions. Suppose that we have samples

$$\mathbf{y_s} = \mathbf{y}(u_s, v_s)$$
 for  $s = 0, ..., N_s$ 

We want to find an approximating polynomial P.

600.445 Fall 2000; Updated: 1 October 2019 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

#### 2D Interpolation: Finding the best fit

Given a set of sample values  $\mathbf{y}_s(u_s,v_s)$  corresponding to 2D coordinates  $(u_s,v_s)$ , left hand side basis functions  $\begin{bmatrix} A_0(u),\cdots,A_m(u) \end{bmatrix}$  and right hand side basis functions  $\begin{bmatrix} B_0(v),\cdots,B_n(v) \end{bmatrix}$ , the goal is to find the matrix  $\mathbf{C}$  of coefficients  $\mathbf{c}_{ij}$ .

To do this, solve the least squares problem

$$\begin{bmatrix} \vdots \\ \mathbf{y}_{s}(u_{s}, v_{s}) \\ \vdots \end{bmatrix} \approx \begin{bmatrix} \vdots & \vdots & \vdots & \vdots \\ A_{0}(u_{s})B_{0}(v_{s}) & A_{0}(u_{s})B_{1}(v_{s}) & \cdots & A_{i}(u_{s})B_{j}(v_{s}) & \cdots & A_{m}(u_{s})B_{n}(v_{s}) \end{bmatrix} = \begin{bmatrix} \mathbf{c}_{00} \\ \mathbf{c}_{01} \\ \vdots \\ \mathbf{c}_{ij} \\ \vdots \\ \mathbf{c}_{mn} \end{bmatrix}$$

# 2D Interpolation: Sampling on a regular grid

A common special case arises when the  $(u_s, v_s)$  form a regular grid. In this case we have  $u_s \in \{u_0, \cdots, u_{N_u}\}$  and  $v_s \in \{v_0, \cdots, v_{N_v}\}$ . For each value  $v_j \in \{v_0, \cdots, v_{N_v}\}$  solve the  $N_s$  row least squares problem

$$\begin{bmatrix} \vdots \\ \mathbf{y}_s(u_s, v_j) \\ \vdots \end{bmatrix} \approx \begin{bmatrix} \vdots & \cdots & \vdots \\ A_0(u_s) & \cdots & A_m(u_s) \\ \vdots & \cdots & \vdots \end{bmatrix} \bullet \begin{bmatrix} \mathbf{X}_{j0} \\ \vdots \\ \mathbf{X}_{jm} \end{bmatrix}$$

for the unknown m-vector  $\mathbf{X}_{i}$ . Then solve m n-variable least squares problems

$$\begin{bmatrix} \mathbf{X}_{00} & \mathbf{X}_{01} & \cdots & \mathbf{X}_{0m} \\ \mathbf{X}_{10} & \mathbf{X}_{11} & \cdots & \mathbf{X}_{1m} \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{X}_{N_{v}0} & \mathbf{X}_{N_{v}1} & \cdots & \mathbf{X}_{N_{v}m} \end{bmatrix} \approx \begin{bmatrix} B_{0}(v_{0}) & B_{1}(v_{0}) & \cdots & B_{n}(v_{0}) \\ B_{0}(v_{1}) & B_{1}(v_{1}) & \cdots & B_{n}(v_{1}) \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ B_{0}(v_{N_{v}}) & B_{1}(v_{N_{v}}) & \cdots & B_{n}(v_{N_{v}}) \end{bmatrix} \bullet \begin{bmatrix} \mathbf{c}_{00} & \mathbf{c}_{10} & \cdots & \mathbf{c}_{m0} \\ \mathbf{c}_{01} & \mathbf{c}_{11} & \cdots & \mathbf{c}_{m1} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{c}_{0n} & \mathbf{c}_{1n} & \cdots & \mathbf{c}_{mn} \end{bmatrix}$$

for the vectors  $[\mathbf{c}_{j0}, \dots, \mathbf{c}_{jn}]$ . Note that this latter step requires only 1 SVD or similar matrix computation.

#### 2D Interpolation: Sampling on a regular grid

- There are a number of caveats to the "grid" method on the previous slide. (E.g., you need enough data for each of the least squares problems). But where applicable the method can save computation time since it replaces a number of m and n variable least squares problems for one big m x n problem
- Note that there is a similar trick that you can play by grouping all the common u<sub>i</sub> elements together.
- Note that the y's and the c's do not have to be scalar numbers. They can be Vectors, Matrices, or other objects that have appropriate algebraic properties

# N-dimensional interpolation

**Define** 

$$F_{i_1\cdots i_N}(\vec{\mathbf{u}}) = A^1_{i_1}(u_1)\cdots A^N_{i_N}(u_N)$$

Then solve the least squares problem

$$\begin{bmatrix} F_{00\cdots0}(\vec{\mathbf{u}}_s) & F_{10\cdots0}(\vec{\mathbf{u}}_s) & \cdots & F_{m_1\cdots m_n}(\vec{\mathbf{u}}_s) \end{bmatrix} \begin{bmatrix} c_{00\cdots0} \\ c_{10\cdots0} \\ \vdots \\ c_{m_1\cdots m_n} \end{bmatrix} \cong \begin{bmatrix} \vdots \\ \vec{\mathbf{y}}_s \\ \vdots \end{bmatrix}$$

đ

#### **N-dimensional interpolation**

 The methods described earlier generalize naturally to N dimensions.

$$P(\mathbf{\bar{u}}) = P(u_1, \dots, u_N) = \sum_{i_1=0}^{m_1} \dots \sum_{i_N=0}^{m_N} c_{i_1 \dots i_n} A^1_{i_1}(u_1) \dots A^N_{i_N}(u_N)$$

where  $A_i^{\kappa}(u)$  can be arbitrary functions

(good choices are Bernstein polynomials or

B-Spline basis functions). Suppose that we have samples

$$\mathbf{y_s} = \mathbf{y}(\mathbf{\vec{u}_s})$$
 for  $\mathbf{s} = 0,...,N_s$ 

We want to find coefficients of  $c_{i_1\cdots i_n}$  approximating polynomial P.

#### **Example: 3D Calibration of Distortion**

Suppose we want to compute a distortion correction function for a distorted 3D navigational sensor. Let

- $\vec{\mathbf{p}}_i = \text{known 3D "ground truth"}$
- $\vec{\mathbf{q}}_i$  = Values returned by navigational sensor

Here we will construct a "tensor form" interpolation polynomial using 5<sup>th</sup> degree Bernstein polynomials

$$F_{ijk}(u_x, u_y, u_z) = B_{5,i}(u_x)B_{5,j}(u_y)B_{5,k}(u_z)$$

We need to do the following:

1. Bernstein polynomials are really designed to work well in the range  $0 \le u \le 1$ , so we need to determine a "bounding box" to scale our  $\vec{\mathbf{q}}_i$  values. I.e., we pick upper and lower limits  $\vec{\mathbf{q}}^{\text{min}}$  and  $\vec{\mathbf{q}}^{\text{max}}$  and compute  $\vec{\mathbf{u}}_s = ScaleToBox(\vec{\mathbf{q}}_s, \vec{\mathbf{q}}^{\text{min}}, \vec{\mathbf{q}}^{\text{max}})$  where

ScaleToBox(x, 
$$x^{min}$$
,  $x^{max}$ ) =  $\frac{x - x^{min}}{x^{max} - x^{min}}$ 

2. Now, we set up and solve the least squares problem:

Engineering Research Center for Computer Integrated Surgical Systems and Technology

# **Example: 3D Calibration of Distortion**

$$\begin{bmatrix} F_{000}(\vec{\mathbf{u}}_{s}) & \cdots & F_{555}(\vec{\mathbf{u}}_{s}) \end{bmatrix} \begin{bmatrix} c_{000}^{x} & c_{000}^{y} & c_{000}^{z} \\ \vdots & \vdots & \vdots \\ c_{555}^{x} & c_{555}^{y} & c_{555}^{z} \end{bmatrix} \cong \begin{bmatrix} \vdots & \vdots & \vdots \\ p_{s}^{x} & p_{s}^{y} & p_{s}^{z} \end{bmatrix}$$

Engineering Research Center for Computer Integrated Surgical Systems and Technology

**G** 

46

# **Example: 3D Calibration of Distortion**

The correction function will then look like this:

$$\begin{split} \vec{\mathbf{p}} &= Correct Distortion(\vec{\mathbf{q}}) \\ \{ & \quad \vec{\mathbf{u}} = Scale To Box(\vec{\mathbf{q}}, \vec{\mathbf{q}}^{\min}, \vec{\mathbf{q}}^{\max}) \\ & \quad \text{return } \sum_{i=0}^{5} \sum_{j=0}^{5} \vec{\mathbf{c}}_{i,j,k} B_{5,i}(u_x) B_{5,j}(u_y) B_{5,k}(u_z) \\ \} \end{split}$$
