

## Model Simplification

- Models used in CIS must be guaranteed to be accurate within known bounds
- But 3D models from medical images often are very complex, and require representations with large data structures.
- Algorithms using models are often computationally expensive, and computation costs go up with model complexity
- **PROBLEM:** reduce model complexity while preserving adequate accuracy

~350,000 triangles!

1

## Model simplification

- Problem is also common in computer graphics
  - There is a growing literature
  - **But** many graphics techniques only care about appearance, and do not necessarily preserve accuracy or other properties (like topological connectivity) important for computational analysis
- Broadly, two classes of approaches
  - Top down
  - Bottom-up

2

## Top down

- Active surfaces used in segmentation
- Deformable registration of an atlas to a patient
  - E.g., skull atlas discussed in craniofacial lecture had about 5000 polygons (perhaps 15-20,000 triangles)
- Recursive approximations
  - E.g., Pizer *et al.* “cores”

## Bottom-up methods

- Typically, start with very high detail model generated from CT images
  - Large number of elements a consequence of small size of pixels & way model is created
- Then merge nearby elements into larger elements
  - E.g., “decimation” (Lorensen, et. al.)
  - E.g., “superfaces” (Kalvin & Taylor)
  - E.g., Gueziec
- An excellent tutorial may be found in:
  - David Luebke; A Developer’s Survey of Polygonal Simplification Algorithms; *IEEE Computer Graphics and Application*, May 2001

## A typical example: Gueziec's Method

- Reference
  - A. Gueziec, "Surface Simplification inside a tolerance volume", *IBM Research Report RC20440*, 5/20/97
- Essentially "triangle decimation" done correctly
  - Preserves topology
  - Preserves volume
  - Provable error bound

12

## Book-keeping to remember hierarchy

Figure 7: A: an edge refers to four indices. B: defining parents of surface elements during an edge collapse.

13

## Picking new vertex to preserve volume

Volume associated with edge star is sum of tetrahedra  
 $v_0$  = vertex associated with simplified vertex star  
 $g_0$  = centroid of edge star

14

## Picking new vertex to preserve volume

Given edge star  $(v_1, v_2)^* = \{v_3, \dots, v_n\}$ . Let  $T_{12}$  be the set of all triangles  $t$  in  $v_1^* \cup v_2^*$  and let  $vertices(t) = \{v_{t1}, v_{t2}, v_{t3}\}$  be the set of vertices associated with a triangle  $t$ . Compute the centroid

$$g = \sum_{i=3}^n \frac{v_i}{n-2} \text{ of } (v_1, v_2)^*.$$

Then the volume associated with the  $(v_1, v_2)^*$  is

$$V_{1,2} = \sum_{t \in T_{12}} V_{tetra}(g, v_{t1}, v_{t2}, v_{t3})$$

We want to pick  $v_0$  such that

$$\sum_{i=3}^{n-1} V_{tetra}(g, v_0, v_i, v_{i+1}) = \sum_{t \in T_{12}} V_{tetra}(g, v_{t1}, v_{t2}, v_{t3})$$

15

## Volume of a tetrahedron

$$V_{tetra}(v_0, v_1, v_2, v_3) = \frac{1}{6} (v_1 - v_0) \bullet (v_2 - v_0) \times (v_3 - v_0)$$

16

## Picking new vertex to preserve volume

- Volume preservation constraint defines a plane on which  $v_0$  must lie.
- Select the point on this plane that minimizes sum-of-squared distance to planes of all triangles being collapsed

## Local enforcement of tight tolerance

Figure 13: Using the tolerance volume to maintain tangency of two surfaces after simplification. From Left to Right, original sphere model (320 triangles) represented with tangent plane, simplified sphere model (82 triangles) with a tolerance equal to 10 % of the sphere diameter; the tangency condition is violated. Simplified sphere model (88 triangles) with the same global tolerance, but with a tolerance of 0 at the contact point.

23

## Algorithm outline

Until Queue/ Last Bucket Empty:

- Take edge with low(est) weight
- If edge can be safely collapsed
  1. If valence does not exceed maximum
  2. If simplified vertex is regular
  3. If triangle normal rotation is acceptable
  4. If triangle compactness is acceptable
  5. If error does not exceed tolerance
  - Change neighboring configuration
  - Remove all edges of the star from the queue
  - Reinststate new edges in the queue
- Else
  - remove edge from queue

32

## Triangle compactness improvement

Figure 11: A visual inspection of these triangles extracted from the shaft of the Femur model shows that facets are more regular in the simplified femur model produced by the our algorithm (Right) than they are in the original output of an iso-surface algorithm (Left). In particular, most "sliver" (very narrow) triangles have been removed. Histograms of triangle compactness presented in Fig.10 confirm this observation.
