Like iterators, references provide pointer-like functionality without many of the pointer drawbacks

*Reference variable* is an *alias*, another name for an existing variable

Restrictions make them safer than pointers:

- Can’t be NULL
- Must be initialized immediately
- Once set to alias a variable, cannot later alias a different variable

Because of these, it’s harder (though still possible) to access memory that doesn’t belong to you via reference
A reference to variable of type int has type int&

- & is part of the type
- Reminds us of “address of” operator &
Example with pointer:

```cpp
#include <iostream>
using std::cout; using std::endl;

int main() {
    int i = 1;
    int *j = &i;
    cout << "i=" << i << ", *j=" << *j << endl;

    *j = 9;
    cout << "i=" << i << ", *j=" << *j << endl;
    return 0;
}
```

$ g++ -c ref_ptr_1.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o ref_ptr_1 ref_ptr_1.o
$ ./ref_ptr_1
i=1, *j=1
i=9, *j=9
Same example with reference:

```cpp
#include <iostream>
using std::cout; using std::endl;

int main() {
    int i = 1;
    int& j = i; // j is an alias (another name) for i
    cout << "i= " << i << " , j= " << j << endl;

    j = 9; // no dereference (*) needed
    cout << "i= " << i << " , j= " << j << endl;
    return 0;
}
```

```
$ g++ -c ref_ptr_2.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o ref_ptr_2 ref_ptr_2.o
$ ./ref_ptr_2
i=1, j=1
i=9, j=9
```
C++: References

You can get the address of a reference variable with &; it has the same address as the variable it aliases.

```cpp
#include <iostream>
using std::cout; using std::endl;

int main() {
    int a = 5;
    int& b = a;
    cout << "&a= " << &a << endl << "&b= " << &b << endl;
    return 0;
}
```

$ g++ -c ref_addr.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o ref_addr ref_addr.o
$ ./ref_addr
&a=0x7ffeb7dacc94
&b=0x7ffeb7dacc94
Function parameters with reference type are passed “by reference”

```c++
// if you have int a = 1, b = 2;
// then call like this: swap(a, b) -- no &s!
void swap(int& a, int& b) {
    int tmp = a;
    a = b;
    b = tmp;
}
```

Passing by reference is like passing by pointer

- Callee can modify variable in caller
- Large data structures can be passed without copying
#include <iostream>

using std::cout; using std::endl;

void swap(int& a, int& b) {
    int tmp = a;
    a = b;
    b = tmp;
}

int main() {
    int a = 1, b = 9;
    swap(a, b);
    cout << "a=" << a << " b=" << b << endl;
    return 0;
}

$ g++ -c ref_swap.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o ref_swap ref_swap.o
$ ./ref_swap
a=9, b=1
Recall this example; ch passed by reference to cin.get(char&)

```cpp
#include <iostream>
#include <cctype>
using std::cout; using std::endl;

int main() {
    char ch;
    // read standard input char by char
    while(cin.get(ch)) { // pass ch by reference!
        cout << toupper(ch);
    }
    cout << endl;
    return 0;
}
```
C++ has both pass-by-value (non-reference parameters) and pass-by-reference (reference parameters).

Function can have a mix of pass-by-value and pass-by-reference parameters.
#include <iostream>

using std::cout;  using std::endl;

// `int a` and `int b` are passed *by value*
// `int& quo` and `int& rem` are passed *by reference*
void divmod(int a, int b, int& quo, int& rem) {
    quo = a / b;
    rem = a % b;
}

int main() {
    int a = 10, b = 3, quo, rem;
    divmod(a, b, quo, rem);
    cout << "a=" << a << " , b=" << b
        << " , quo=" << quo << " , rem=" << rem << endl;
    return 0;
}
$ g++ -c divmod_ref.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o divmod_ref divmod_ref.o
$ ./divmod_ref
a=10, b=3, quo=3, rem=1
Looking at the function call doesn't tell you which parameters are passed by value or by reference:

```c
divmod(a, b, quo, rem); // ???
```

You have to look at the callee's parameter types:

```c
void divmod(int a, int b, int& quo, int& rem) {
    ...
}
```
We can return a reference

```cpp
#include <iostream>
using std::cout; using std::endl;

int& minref(int& a, int& b) {
    if(a < b) {
        return a;
    } else {
        return b;
    }
}

int main() {
    int a = 5, b = 10;
    int& min = minref(a, b);
    min = 12;
    cout << "a=" << a << ", b=" << b << ", min=" << min << endl;
    return 0;
}
```
$ g++ -c ref_min.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o ref_min ref_min.o
$ ./ref_min
a=12, b=10, min=12

minref returns a reference to a

min = 12 modifies both min and a

What if we make minref’s arguments non-references?
#include <iostream>
using std::cout;  using std::endl;

int& minref(int a, int b) {
    if(a < b) {
        return a;
    } else {
        return b;
    }
}

int main() {
    int a = 5, b = 10;
    int& min = minref(a, b);
    min = 6;
    cout << "a=" << a << " b=" << b << " min=" << min << endl;
    return 0;
}
$ g++ -c %PREV% -std=c++11 -pedantic -Wall -Wextra
ref_min_2.cpp: In function 'int& minref(int, int)'
  ref_min_2.cpp:4:17: warning: reference to local variable 'a' returned
    ^
  ref_min_2.cpp:4:24: warning: reference to local variable 'b' returned
    ^
Returning a reference to a local variable is just as bad as returning a pointer to one. In our original `minref` function, this was OK because the parameters themselves were references.

```cpp
int& minref(int& a, int& b) {
    if(a < b) {
        return a;
    } else {
        return b;
    }
}
```
Once a reference is set to alias a variable, it cannot later be set to alias another variable

Example...
#include <iostream>

using std::cout; using std::endl;

int main() {
    int a = 5, b = 10;
    int& c = a;
    cout << "a:" << a << "c:" << c << endl;
    c = b; // this *doesn't* change c to alias b
    // instead, sets c (and a) to 10
    cout << "a:" << a << "c:" << c << endl;
    return 0;
}

$ g++ -c ref_reset.cpp -std=c++11 -pedantic -Wall -Wextra
$ g++ -o ref_reset ref_reset.o
$ ./ref_reset
a=5, c=5
a=10, c=10
A reference variable must be initialized immediately

```cpp
#include <iostream>
using std::cout; using std::endl;

int main() {
    int& a; // won't compile
    int b = 10;
    a = b;
    cout << a << endl;
    return 0;
}
```

```
$ g++ -c ref_delay.cpp -std=c++11 -pedantic -Wall -Wextra
ref_delay.cpp: In function 'int main()':
ref_delay.cpp:5:10: error: 'a' declared as reference but not initialized
    int& a; // won't compile
^`
```
A reference cannot be NULL

```cpp
#include <iostream>
using std::cout; using std::endl;

int main() {
    int& a = NULL;
    if (a == NULL) {
        cout << "a is NULL" << endl;
    }
    return 0;
}
```
C++: References

$ g++ -c ref_null.cpp -std=c++11 -pedantic -Wall -Wextra

A reference can be const

- const reference cannot be modified after initialization

You may still be able to modify the original variable

- ...if it’s non-const, or
- ...via a non-const reference to the same variable
#include <iostream>

using std::cout;  using std::endl;

int main() {
    int a = 1;
    int& b = a;
    const int& c = a;
    a = 2;
    cout << "a=" << a << " , b=" << b << " , c=" << c << endl;
    b = 3; // this is fine
    cout << "a=" << a << " , b=" << b << " , c=" << c << endl;
    c = 4; // *** not allowed ***
    cout << "a=" << a << " , b=" << b << " , c=" << c << endl;
    return 0;
}
$ g++ -c ref_const.cpp -std=c++11 -pedantic -Wall -Wextra

ref_const.cpp: In function 'int main()':
ref_const.cpp:12:9: error: assignment of read-only reference 'c'
    c = 4; // *** not allowed ***
   ^
