

A Non-Photorealistic Lighting Model for Automatic Technical Illustration

from Gooch, Gooch, Shirley, and Cohen, *SIGGRAPH 98*.

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Technical Illustration Goals

Shape information more important than photorealism

“Make all visual distinctions as subtle as possible, but still clear and effective”

- **Tufte**

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Technical Illustration Characteristics

Edge lines drawn with black curves

- boundaries, silhouettes, discontinuities

White highlights from single light source

Shading stays far from black and white

- limited intensity range

Hue changes (warm to cool) help to indicate surface normal

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Phong Illumination

highlights lost
edge lines would be hard to see
no variation dark regions

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Solid Color + Highlights and Edges

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Restricted Intensity Phong + Edges

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Diffuse Illumination

Standard Lambertian Model

$$I = k_d * k_a + k_d * \max(0, l.n)$$

- Points with normals away from light all constant color

Color Interpolation Model

$$I = (1 + l.n)/2 * k_1 + [1 - (1 + l.n)/2] * k_2$$

- Variation across entire range of normals

$$-l.n \in [-1, 1]$$

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Color Temperature Principles

Warm colors approach

- Red, yellow, orange

Cool temperatures recede

- Blue, violet, green

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Cool-to-Warm Illumination

Blue-to-yellow illumination

- $k_1 = \text{blue} = (0,0,b)$
- $k_2 = \text{yellow} = (y,y,0)$

Scaled object-color illumination

- $k_1 = \text{black} = (0,0,0)$
- $k_2 = \text{object color} = k_d$

Combined model

- $k_1 = k_{\text{cool}} = (0,0,b) + \alpha k_d$
- $k_2 = k_{\text{warm}} = (y,y,0) + \beta k_d$

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Constant Luminance, Changing Hue

Approximating Cool-to-Warm Illumination in OpenGL

Two directional lights

- Direction L , intensity $(k_{\text{warm}} - k_{\text{cool}})/2$
- Direction $-L$, intensity $(k_{\text{cool}} - k_{\text{warm}})/2$
—Negative intensities are legal!

Ambient light

- Intensity $(k_{\text{cool}} + k_{\text{warm}})/2$

White surface color

Add white highlights using second pass

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Illustrative Metal Shading

Milled metals exhibit streaks along milling axis

Simulate this anisotropy using stripes of various intensities along milling axis

- **Random stripe intensities from 0.0 to 0.5**
- **Stripe closest to light direction is white**
- **Linearly interpolate colors between stripes**

Johns Hopkins Department of Computer Science
Course 600.456: Rendering Techniques, Professor: Jonathan Cohen

Metal Shading + Edges

Phong

Metal
