CS 318 Principles of Operating Systems

Fall 2017

Lecture 17: File System Crash Consistency

Ryan Huang

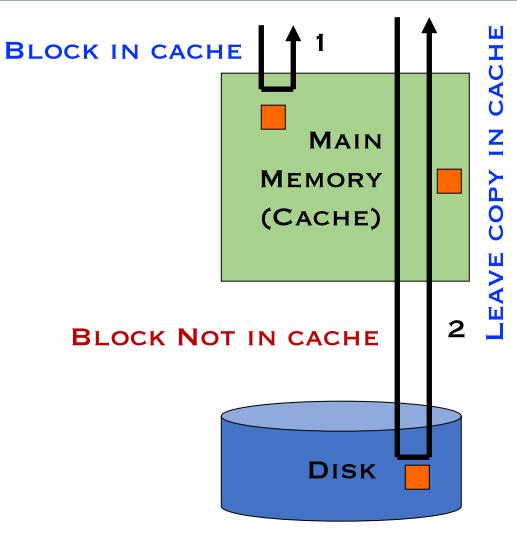

Administrivia

- Lab 3 deadline Thursday Nov 9th 11:59pm
- Thursday class cancelled, work on the lab
- Some test cases will be changed to extra credit
- Extra (Ryan's) office hours this week
 - Tuesday 3-4pm
 - Wednesday 2-4pm

Review: File I/O Path (Reads)

• read() from file

- Check if block is in cache
- If so, return block to user
 [1 in figure]
- If not, read from disk, insert into cache, return to user [2]

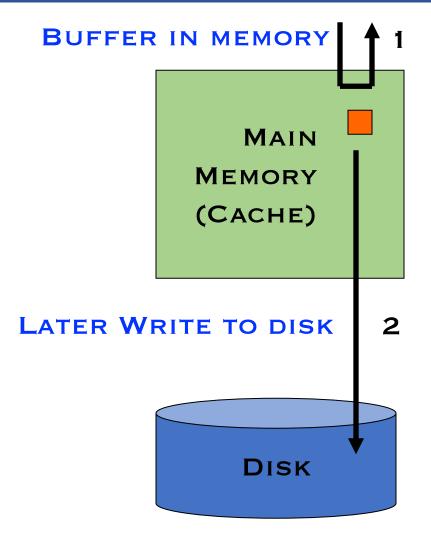

Review: File I/O Path (Writes)

• write() to file

- Write is buffered in memory ("write behind") [1]
- Sometime later, OS decides to write to disk [2]
 - Periodic flush or fsync call

Why delay writes?

- Implications for performance
- Implications for reliability

The Consistent Update Problem

 Atomically update file system from one consistent state to another, which may require modifying several sectors, despite that the disk only provides atomic write of one sector at a time

- What do we mean by consistent state?

Example: File Creation

Initial state

MEMORY

_															
Disk	01000	01000		/											
-	inode map	block map		inode array						data blocks					
11/7/17	CS 318 – Lecture 17 – File System Crash Consistency												6		

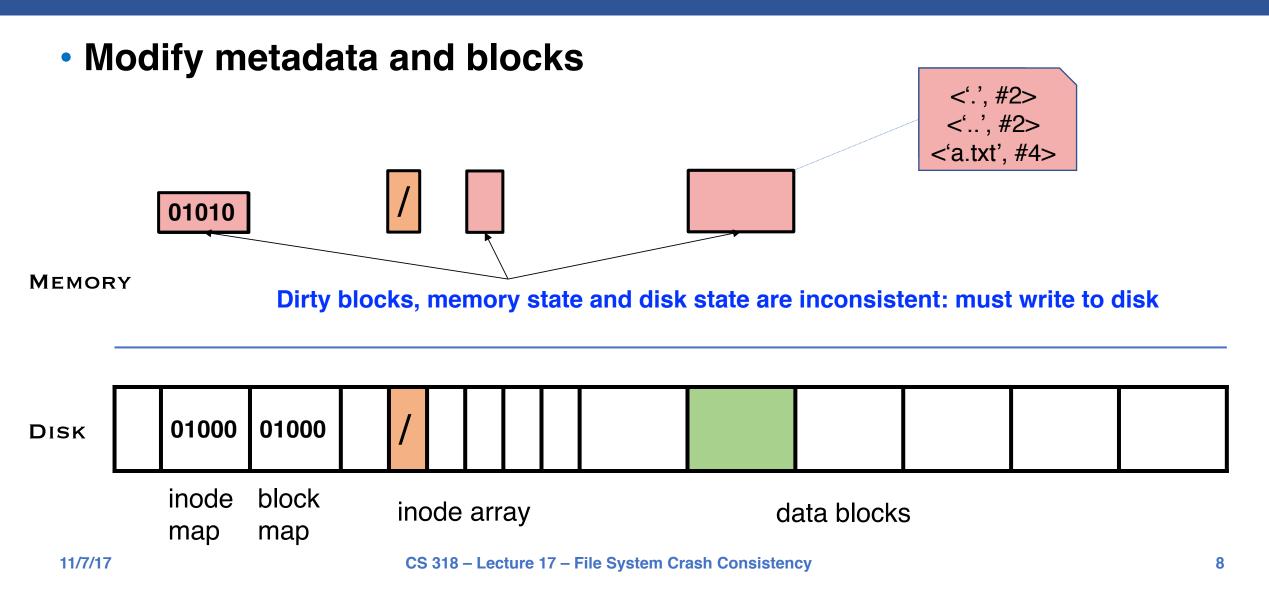

Example: File Creation

MEMORY

_														
Disk	01000	01000	/	,										
_	inode map	block map	i	inode array					d					
11/7/17		CS 318 – Lecture 17 – File System Crash Consistency												7

Example: File Creation

Crash?

Disk: atomically write one sector

- Atomic: if crash, a sector is either completely written, or none of this sector is written
- An FS operation may modify multiple sectors

Possible Crash Scenarios

File creation dirties three blocks

- inode bitmap (B)
- inode for new file (I)
- parent directory data block (D)

Old and new contents of the blocks

- B = 01000 B' = 01010
- I = free I' = allocated, initialized
- D = {} D' = {<'a.txt', 3>}

Possible Crash Scenarios

Crash scenarios: any subset can be written

- B I D
- B' I D
- B I' D
- B I D'
- B' I' D
- B' I D'
- B I' D'
- B' I' D'

The General Problem

Writes: Have to update disk with N writes

- Disk does only a single write atomically

Crashes: System may crash at arbitrary point

- Bad case: In the middle of an update sequence

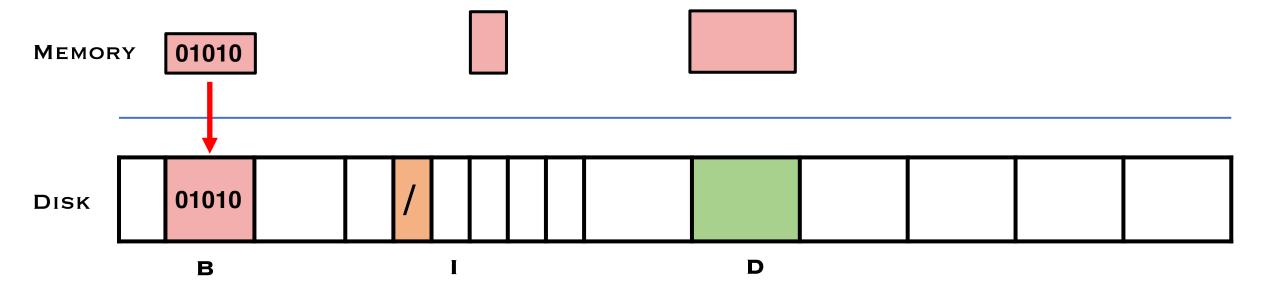

Desire: To update on-disk structures atomically

- Either all should happen or none

Example: Bitmap First

• Write Ordering: Bitmap (B), Inode (I), Data (D)

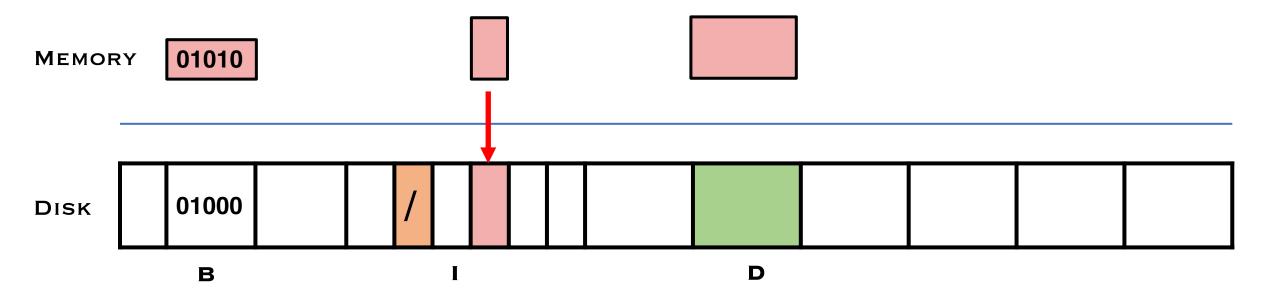

- But CRASH after B has reached disk, before I or D
- Result?

Example: Inode First

• Write Ordering: Bitmap (B), Inode (I), Data (D)

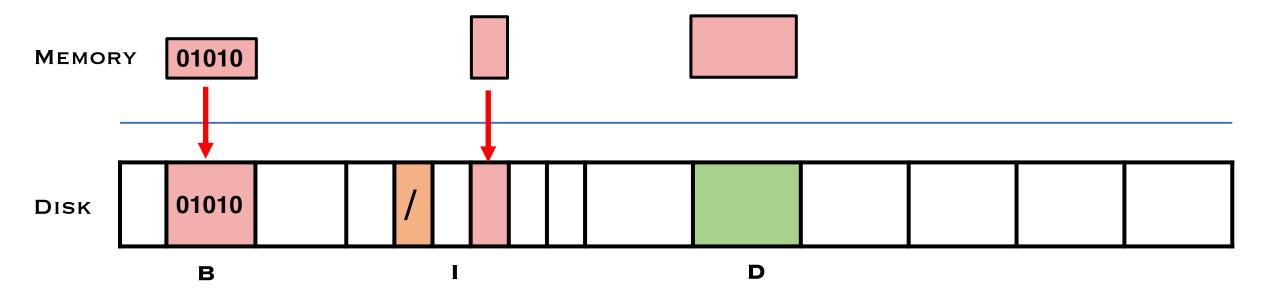

- But CRASH after I has reached disk, before B or D
- Result?

Example: Inode First

• Write Ordering: Bitmap (B), Inode (I), Data (D)

- But CRASH after I AND B have reached disk, before D
- Result?

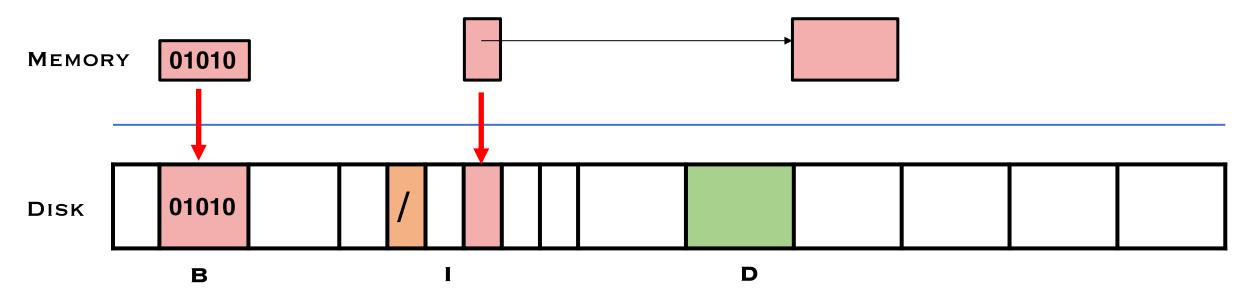

Example: Inode First

• Write Ordering: Bitmap (B), Inode (I), Data (D)

- But CRASH after I AND B have reached disk, before D

Result?

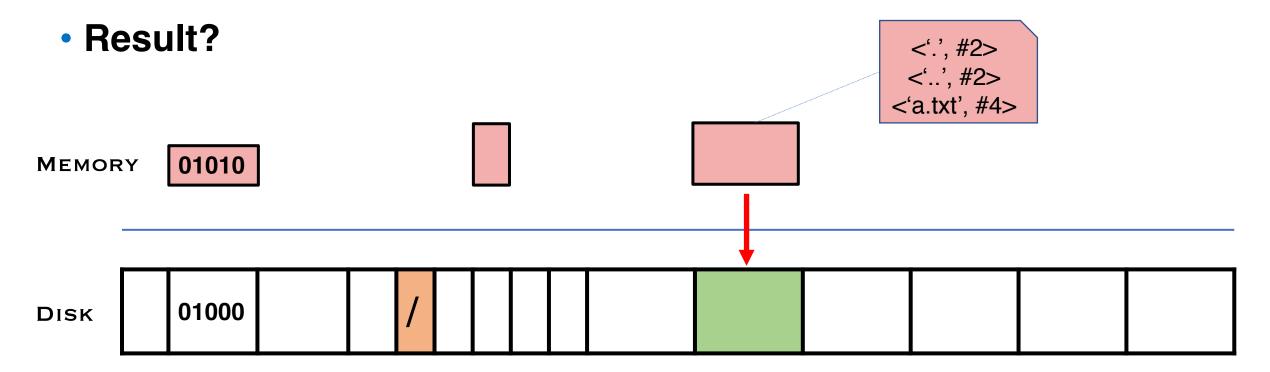

- What if data block is a new block for the new file (i.e., create file with data)

Example: Data First

• Write Ordering: Data (D), Bitmap (B), Inode (I)

- CRASH after D has reached disk, before I or B

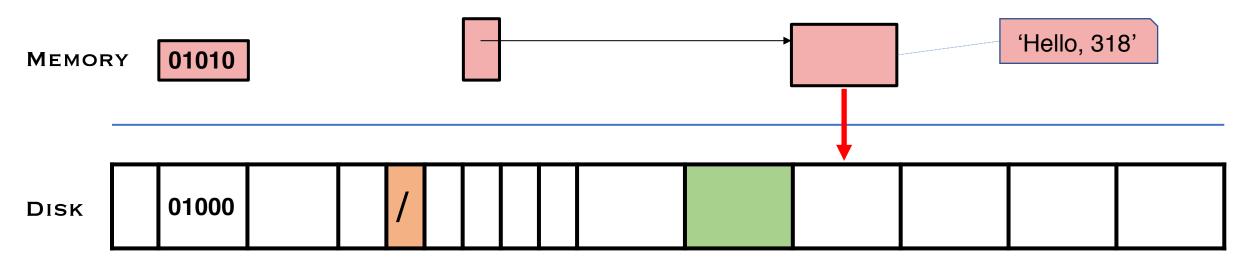

Example: Data First

• Write Ordering: Data (D), Bitmap (B), Inode (I)

- CRASH after D has reached disk, before I or B

Result?

- What if data block is a new block for the new file (i.e., create file with data)

Traditional Solution: FSCK

FSCK: "file system checker"

When system boots:

- Make multiple passes over file system, looking for inconsistencies
 - e.g., inode pointers and bitmaps, directory entries and inode reference counts
- Either fix automatically or punt to admin
 - Example: B' I D, B I' D,
 - Can B' I D' be fixed? (cannot fix all crash scenarios)
- Does fsck have to run upon every reboot?

• Problem:

- Performance
 - Sometimes takes hours to run on large disk volumes
- Not well-defined consistency

Another Solution: Journaling

Idea: Write "intent" down to disk before updating file system

- Called the "Write Ahead Logging" or "journal"
- Originated from database community

When crash occurs, look through log to see what was going on

- Use contents of log to fix file system structures
 - Crash before "intent" is written → no-op
 - Crash after "intent" is written → redo op
- The process is called "recovery"

Case Study: Linux Ext3

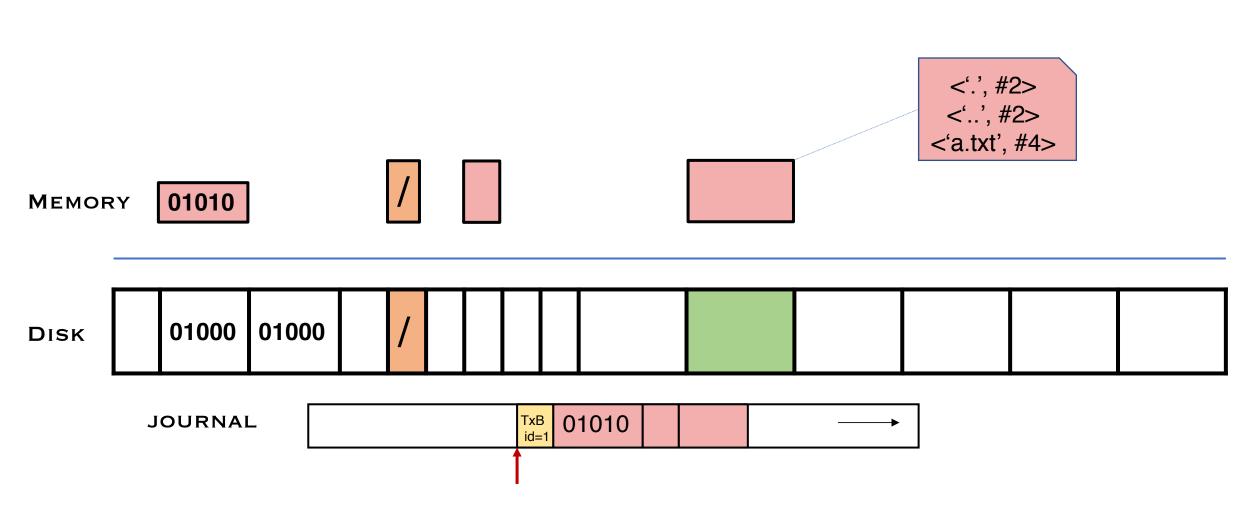

Physical journaling: write real block contents of the update to log

- Four totally ordered steps
 - Commit dirty blocks to journal as one transaction (TxBegin, I, B, D blocks)
 - Write commit record (TxEnd)
 - Copy dirty blocks to real file system (checkpointing)
 - Reclaim the journal space for the transaction

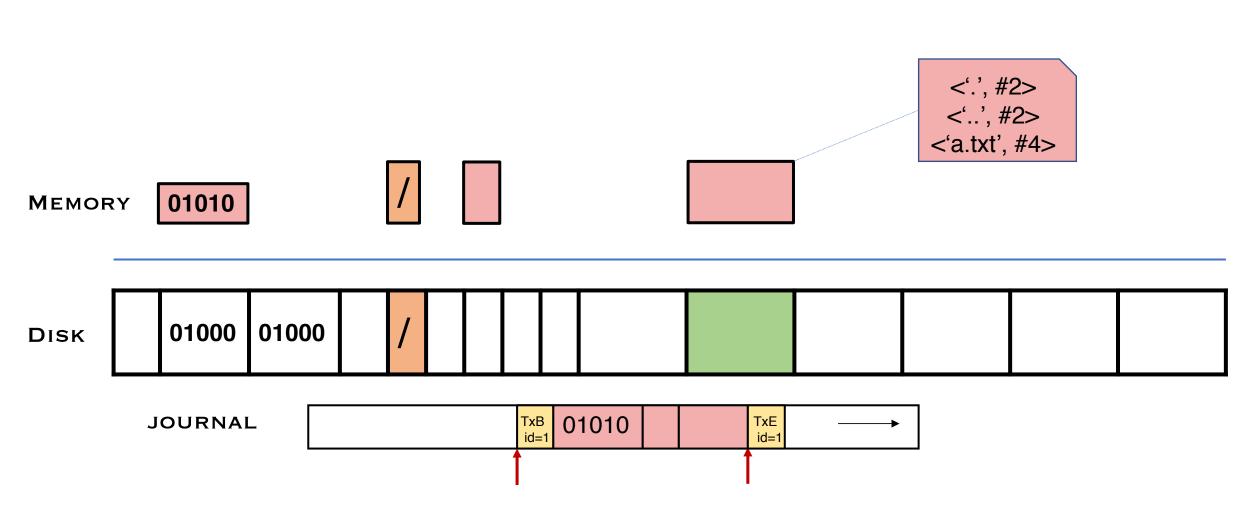

Logical journaling: write logical record of the operation to log

- "Add entry F to directory data block D"
- Complex to implement
- May be faster and save disk space

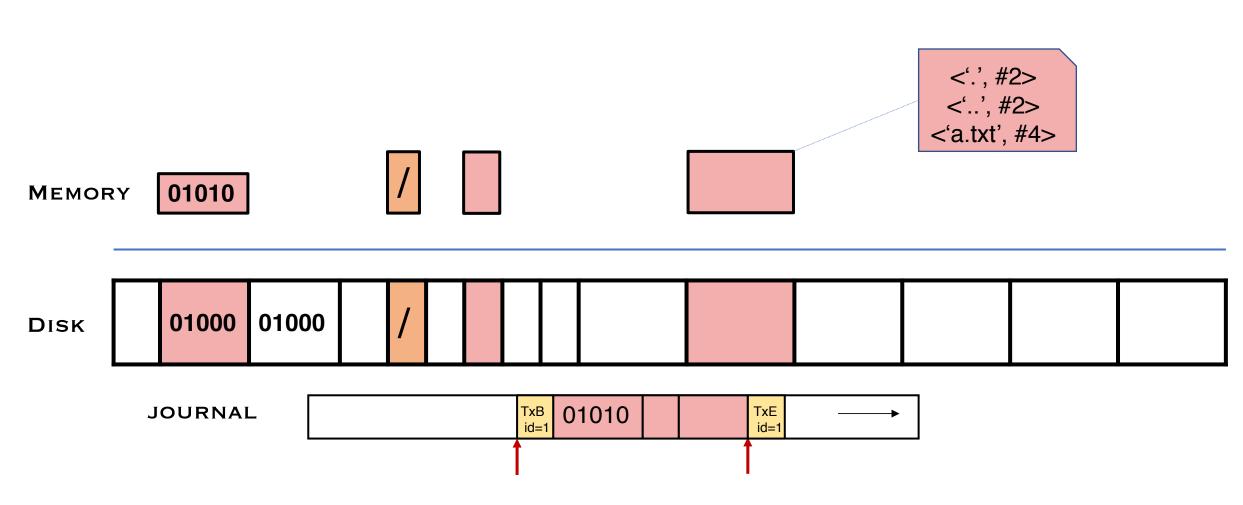

Step 1: Write Blocks to Journal

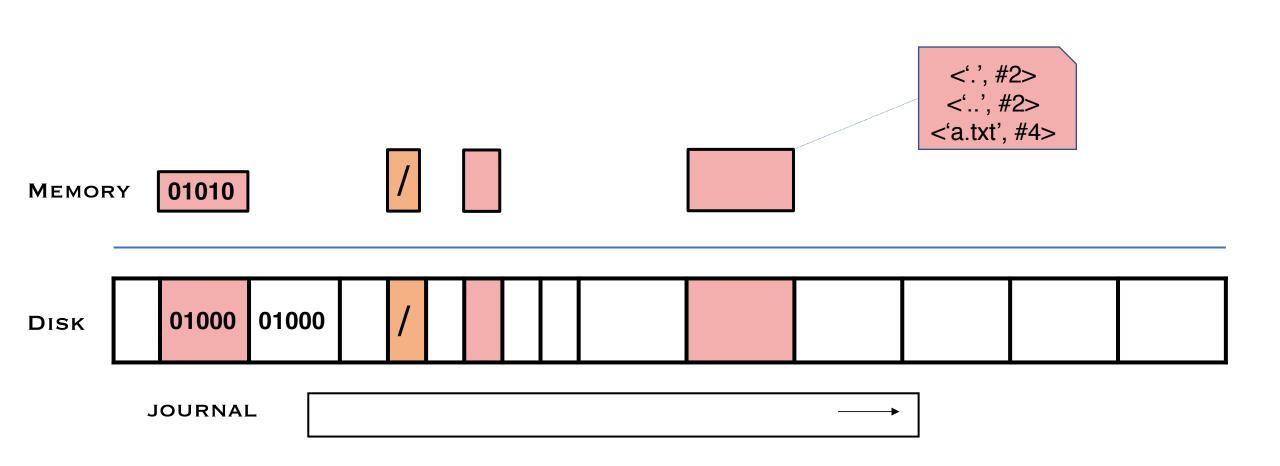

Step 2: Write Commit Record

Step 3: Copy Dirty Blocks to Real FS

Step 4: Reclaim Journal Space

What If There Is A Crash?

 Recovery: Go through log and "redo" operations that have been successfully committed to log

• What if ...

- TxBegin but not TxEnd in log?
- TxBegin through TxEnd are in log, but I, B, and D have not yet been checkpointed?
 - How could this happen?
 - Why don't we merge step 2 and step 1?
- What if Tx is in log, I, B, D have been checkpointed, but Tx has not been freed from log?

Summary of Journaling Write Orders

Journal writes < FS writes

- Otherwise, crash -> FS broken, but no record in journal to patch it up

FS writes < Journal clear

- Otherwise, crash -> FS broken, but record in journal is already cleared

Journal writes < commit record write < FS writes

- Otherwise, crash -> record appears committed, but contains garbage

Ext3 Journaling Modes

- Journaling has cost
 - one write = two disk writes, two seeks
- Several journaling modes balance consistency and performance
- Data journaling: journal all writes, including file data
 - Problem: expensive to journal data
- Metadata journaling: journal only metadata
 - Used by most FS (IBM JFS, SGI XFS, NTFS)
 - Problem: file may contain garbage data

• Ordered mode: write file data to real FS first, then journal metadata

- Default mode for ext3
- Problem: old file may contain new data

Summary

The consistent update problem

- Example of file creation and different crash scenarios

Two approaches to crash consistency

- FSCK: slow, not well-defined consistency
- Journaling: well-defined consistency, different modes

Other approach

- Soft updates (advanced OS topics)
