## Introduction

Last time: Definition of $\mathbf{P}, \mathbf{N P}$, reductions, NP-completeness. Proof that Circuit-SAT is NP-complete.

Today: more NP-complete problems.

## Definition

A decision problem $\mathbf{Q}$ is in NP (nondeterministic polynomial time) if there exists a polynomial time algorithm $\mathbf{V}(\mathbf{I}, \mathbf{X})$ (called the verifier) such that

1. If $\mathbf{I}$ is a $Y E S$-instance of $\mathbf{Q}$, then there is some $\mathbf{X}$ (usually called the witness, proof, or solution) with size polynomial in $|\boldsymbol{\|}|$ so that $\mathbf{V}(\mathbf{I}, \mathbf{X})=$ YES.
2. If $\mathbf{I}$ is a NO -instance of $\mathbf{Q}$, then $\mathbf{V}(\mathbf{I}, \mathbf{X})=\mathrm{NO}$ for all $\mathbf{X}$.

## Reductions

## Definition

A Many-one or Karp reduction from $\mathbf{A}$ to $\mathbf{B}$ is a function $\mathbf{f}$ which takes arbitrary instances of $\mathbf{A}$ and transforms them into instances of $\mathbf{B}$ so that

1. If $\mathbf{x}$ is a YES-instance of $\mathbf{A}$ then $\mathbf{f}(\mathbf{x})$ is a YES-instance of $\mathbf{B}$.
2. If $\mathbf{x}$ is a NO-instance of $\mathbf{A}$ then $\mathbf{f}(\mathbf{x})$ is a NO-instance $\mathbf{B}$.
3. $\mathbf{f}$ can be computed in polynomial time.

## Definition

Problem $\mathbf{Q}$ is NP-hard if $\mathbf{Q}^{\prime} \leq_{\mathbf{p}} \mathbf{Q}$ for all problems $\mathbf{Q}^{\prime}$ in $\mathbf{N P}$. Problem $\mathbf{Q}$ is NP-complete if it is NP-hard and in NP.

## Circuit-SAT

## Definition

Circuit-SAT: Given a boolean circuit of AND, OR, and NOT gates, with a single output and no loops (some inputs might be hardwired), is there a way of setting the inputs so that the output of the circuit is $\mathbf{1}$ ?

## Theorem

## Circuit-SAT is NP-complete.

## 3-SAT

Boolean formula:

- Boolean variables $\mathbf{x}_{1}, \ldots, \mathbf{x}_{\mathbf{n}}$
- Literal: variable $\mathbf{x}_{\mathbf{i}}$ or negation $\overline{\mathbf{x}_{\mathbf{i}}}$
- AND: $\wedge$ OR: v
- $\mathrm{x}_{1} \vee\left(\overline{\mathrm{x}_{5}} \wedge \mathrm{x}_{7}\right) \wedge\left(\overline{\mathrm{x}_{2}} \vee\left(\mathrm{x}_{6} \wedge \overline{x_{3}}\right)\right) \ldots$

Conjunctive normal form (CNF): AND of ORs (clauses)

- $\left(x_{1} \vee \overline{x_{2}} \vee \overline{x_{4}}\right) \wedge\left(x_{2} \vee x_{3}\right) \wedge\left(x_{1} \vee x_{4} \vee \overline{x_{6}}\right) \ldots$

## Definition

3-SAT: Instance is 3CNF formula $\phi$ (every clause has $\leq \mathbf{3}$ literals). YES if there is assignment where $\phi$ evaluates to True (satisfying assignment), NO otherwise.

Theorem
3-SAT is NP-complete.

3-SAT in NP:

3-SAT is NP-complete.

3-SAT in NP: witness is assignment, verifier checks that formula evaluates to True on assignment.

3-SAT is NP-hard: Show Circuit-SAT $\leq_{p} 3-S A T$.

- Don't need to show that $\mathbf{A} \leq_{\boldsymbol{p}} 3-S A T$ for arbitrary $\mathbf{A} \in \mathbf{N P}$ : already know that $\mathbf{A} \leq_{\mathbf{p}}$ Circuit-SAT!

So start with circuit. Want to transform to 3-CNF formula.

## Transformation to NANDs

For simplicity, transform into a circuit with one type of gate: NAND (NOT AND)

- AND/OR/NOT universal, but so is just NAND!

## Transformation to NANDs

For simplicity, transform into a circuit with one type of gate: NAND (NOT AND)

- AND/OR/NOT universal, but so is just NAND!

So given circuit C, first transform it into NAND-only circuit.

Input:

- $\mathbf{n}$ "input wires" $\mathbf{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}$
- m NAND gates: $\mathbf{g}_{1}, \ldots, \mathbf{g}_{\mathbf{m}}$
- $\mathrm{g}_{1}=\operatorname{NAND}\left(\mathrm{x}_{1}, \mathrm{x}_{3}\right)$, $\mathrm{g}_{2}=\operatorname{NAND}\left(\mathrm{g}_{1}, \mathrm{x}_{4}\right), \ldots$
- WLOG, $\mathbf{g}_{\mathbf{m}}$ is the "output gate"

## Reduction to 3-SAT

So given as input a circuit $\mathbf{C}$ :

- $\mathbf{n}$ "input wires" $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}$
- m NAND gates: $\mathbf{g}_{\mathbf{1}}, \ldots, \mathbf{g}_{\mathbf{m}}$. Output gate $\mathbf{g}_{\mathbf{m}}$

Need to construct many-one reduction $\mathbf{f}$ to 3-SAT: in polynomial time, construct 3-CNF formula $\mathbf{f}(\mathbf{C})$ such that $\mathbf{f}(\mathbf{C})$ has a satisfying assignment if and only if $\mathbf{C}$ has an input where it outputs 1.

$\Longrightarrow C$ a YES instance of Circuit-SAT

## General Methodology to Prove Q NP-Complete

1. Show $\mathbf{Q}$ is in $\mathbf{N P}$

- Can verify witness for YES
- Can catch false witness for NO (or contrapositive: if witness is verified, then a YES instance)

2. Find some NP-hard problem $\mathbf{A}$. Reduce from $\mathbf{A}$ to $\mathbf{Q}$ :

- Given instance $\mathbf{I}$ of $\mathbf{A}$, turn into $\mathbf{f}(\mathbf{I})$ of $\mathbf{Q}$ (in time polynomial in $|\mathbf{I}|$ )
- I YES of $\mathbf{A}$ if and only if $\mathbf{f}(\mathbf{I})$ YES of $\mathbf{Q}$

## General Methodology to Prove Q NP-Complete

1. Show $\mathbf{Q}$ is in $\mathbf{N P}$

- Can verify witness for YES
- Can catch false witness for NO (or contrapositive: if witness is verified, then a YES instance)

2. Find some NP-hard problem $\mathbf{A}$. Reduce from $\mathbf{A}$ to $\mathbf{Q}$ :

- Given instance $\mathbf{I}$ of $\mathbf{A}$, turn into $\mathbf{f}(\mathbf{I})$ of $\mathbf{Q}$ (in time polynomial in $|\mathbf{I}|$ )
- I YES of $\mathbf{A}$ if and only if $\mathbf{f}(\mathbf{I})$ YES of $\mathbf{Q}$

## Notes:

- Careful about direction of reduction!!!!
- Need to handle arbitrary instances of A, but can turn into very structured instances of $\mathbf{Q}$
- Often easiest to prove NO direction via contrapositive, to turn into statement about YES:
- I YES of $\mathbf{A} \Longrightarrow \mathbf{f}(\mathbf{I})$ YES of $\mathbf{Q}$
- $\mathbf{f}(\mathbf{I})$ YES of $\mathbf{Q} \Longrightarrow \mathbf{I}$ YES of $\mathbf{A}$
- So proving "both directions", but reduction only in one direction.

## Clique

Definition: A clique in an undirected graph $\mathbf{G}=(\mathbf{V}, \mathbf{E})$ is a set $\mathbf{S} \subseteq \mathbf{V}$ such that $\{\mathbf{u}, \mathbf{v}\} \in \mathbf{E}$ for all $\mathbf{u}, \mathbf{v} \in \mathbf{S}$

## In NP:

- Witness: S $\subseteq$ V
- Verifier: Checks if $\mathbf{S}$ is a clique and $|\mathbf{S}| \geq \mathbf{k}$
- If ( $\mathbf{G}, \mathbf{k}$ ) a YES instance: there is a clique $\mathbf{S}$ of size $\geq \mathbf{k}$ on which verifier returns YES

Given 3-SAT formula $\mathbf{F}$ (with $\mathbf{n}$ variables and $\mathbf{m}$ clauses), set $\mathbf{k}=\mathbf{m}$ and create graph $\mathbf{G}=(\mathbf{V}, \mathbf{E})$ :

- For every clause of $\mathbf{F}$, for every satisfying assignment to the clause, create vertex
- Add an edge between consistent assignments
