## ABSTRACT

Data from the U.S. Census and more limited surveys aimed at specific artist occupations were used to profile the employment and earnings of four groups of artists in 1970-1990: authors, artists who work with their hands, performing artists, and architects and designers. The following items were examined: evidence of multiple job holding; reliability/consistency of data from various sources; growth of the field; geographic areas where individuals in the field are most likely to live and work; age, sex, and racial patterns in the field; education, employment, and income levels for the field and its various subfields; satisfaction with the field; and challenges facing individuals working in the field. Income and employment levels varied widely both between and within the four occupational groups examined. The numbers of people employed in all the occupations examined increased significantly during the decades examined. In 1989, authors' total earnings averaged \$23,335. In 1990, the median income for full-time female painters/craft artists was \$18,762. In 1989, actors/directors, dancers, musicians, decorators/designers, and architects had median incomes of \$22,000, \$8,500, \$9,900, \$45,873, and \$56,773, respectively. In general, women tended to earn less than their male counterparts. (MN)

## Executive Summary

The focus of this report commissioned by the National Endowment for the Arts is on four distinct groups of artists: authors, architects and designers, performing artists and artists who work with their hands. The report attempts to answer certain basic questions about where artists live and work and what they earn. Do they support their art or does it support them? How well did the growth and changes in art occupations over the two decades covered by the report keep pace with those of professionals in other fields with comparable education and training? The report also examines trends regarding the artists' economic conditions, age, gender, race, ethnicity, education, area of residence, employment sector, earnings and multiple job holdings. An underlying assumption throughout the report is that the intrinsic rewards for artists in doing the work they most want to do cannot be quantified.

The authors of the four sections of the report represent different disciplines in art, education, and economics, but they share a general concern for the art world and its career participants. They worked independently, focusing on their specialized fields and studying existing data bases, including those of the U. S. Census, various surveys of artists and industry records. Although they were often researching similar information on artist occupations, the authors approached their studies from different perspectives, using various analytical techniques. The result of their efforts is a comprehensive, revealing look at issues affecting the entire set of artist occupations covered by the Census from 1970 to 1990.

The authors generally agree on the advantages and limitations of using data from the broad-based Census and the more limited, but closely targeted, surveys aimed at specific artist occupations. They also concur that continuing research will lead to a better understanding of the opportunities and challenges today's artists experience.

Because these authors can best highlight the findings of their individual studies, their summaries of these findings appear here. It is hoped that by combining these findings in one area, both the similarities and differences of employment experiences in the four art fields will be apparent.

### Employment and Earnings of Authors

Neil O. Alper and Gregory H. Wassall researched and wrote the section of this report on authors. They found that writing occupations have grown rapidly the last two decades, but that writers still constitute a very small fraction of the nation's labor force—in 1990 American authors numbered about 107,000 or just nine in 10,000 members of the labor force. Alper and Wassall used the broadest definition of authors: all persons who indicated occupational membership, regardless of being in the labor force at Census time. The researchers compared the employment and earnings of authors to all artists, editors and reporters, technical writers, and all professional and technical workers other than artists.

Briefly, here are some of their major findings from U.S. Census data:

## 2 | Artists in the Work Force

- **Education.** Authors were found to be well educated, averaging 15.8 years of education in 1990, more than other artists and professional/technical workers.
- **Age.** Authors averaged 44 years of age, which was four to five years older than reference groups used (other professional workers and all artists).
- **Residence.** California and New York are home to more authors than other states, with the Los Angeles and New York City metropolitan areas claiming the highest percentages of writers in their labor forces.
- **Gender and ethnicity.** Half of all authors were men in 1990 and 95 percent were white. Over the 1970-1990 period the author profession had a lower percentage of minorities than artists or other professional/technical workers. It had a higher percentage of women than did the artist profession, but a lower percentage than other professional/technical occupations.
- **Unemployment.** In 1990 only 40 percent of authors worked full time year-round, compared to 46 percent of artists and 56 percent of other professional and technical workers who worked full-time.
- **Employment sector.** Compared to the average artist and professional or technical workers, authors were far more likely to be self-employed and less likely to work for private sector employers.
- **Earnings.** In 1989 authors' total earnings averaged \$23,335, less than other professional workers, editors and reporters and technical writers, but more than other artists. Authors' total personal income was \$30,089 and their average total household income, \$62,083 (leading all reference groups in household income). Between 1969 and 1989, the earnings of authors grew by 175 percent, which lagged behind the reference groups and behind inflation. From 1969 through 1989, a higher percentage of authors had zero or negative earnings, and a higher percentage earned over \$90,000 than any of the reference groups.

In 1989 women authors earned only 52 percent of male writers' earnings.

Black authors earned 91 percent of white; Hispanics earned 87 percent.

Several studies of artists from 1979 to 1989 found that 70 to 90 percent of authors worked at other jobs during the year, often simultaneously with their writing. The majority of second jobs for authors were professional in their nature. Their writing-related jobs were primarily teaching. Without income from their second or multiple jobs, a majority of authors would be classified as poor.

Non-Census sources, such as artist surveys and union records, confirm many of the Census findings, including the facts that authors are primarily white with an average age around 40 and are well-educated compared to the general population. As to gender, some of the studies showed an even distribution of males and females, some 60 percent female, and union records accounted for only 22 percent female.

Regarding income, non-Census surveys showed female authors consistently earned less than males, with different studies showing a range from about 40 percent of male earnings to about 75 percent by 1991. The income of other family members was found to be important in aiding writers to work at their craft and to stay well above poverty thresholds.

The Columbia Authors' Guild study and the Writers' Guild studies found earnings to vary greatly related to the type of writing and the employer. Generally,

poets earned the least from their craft, authors of academically oriented non-fiction somewhat more, writers of children's books and general adult fiction were in the middle, and writers of "genre" fiction earned the most. Writers in television earned about 3 percent more than film writers in 1991. Those who worked for major TV or film production companies earned more than those working for smaller production companies, with those working for the major film production companies in 1991 having median earnings 115 percent higher than writers working for independent producers.

### Artists Who Work with Their Hands

Joan Jeffri and Robert Greenblatt wrote the section of this report which examines trends in the visual arts occupations of painters, sculptors, craft artists and artist printmakers. Major areas they examined, using Census data and artist population surveys, are geographic distribution, age, education, employment and earnings. Highlights of their findings appear here.

Between 1970 and 1990 the total artist population more than doubled, from 720,000 to 1,671,000. By 1990, painters and craft artists totaled 191,160, or 13 percent of all artists, the second largest of all artist occupations. Female painters/craft artists by 1990 numbered 107,920, or 56 percent. For male painters/craft artists, the rate of growth declined from 64 percent in 1970 to 44 percent in 1990.

While about three-fourths of these artists are urban residents, these percentages have declined from 1980. Male painters and craft artists had their highest proportions in the West in 1990, while their female counterparts moved South and substantially decreased in the Northwest.

Median ages for male painters/craftspeople were higher at 40 than for all male artists at 37 and higher than the general labor force. Female median ages of 39 years were higher than for all female artists at 37, but similar to the general labor force. Both male and female painters/craftspeople had median ages of 41 in a Research Center for Arts and Culture study done at the time.

The area of education seems to prove the most difficult when comparing Census figures to discrete survey figures. According to the Census, education for both male and female painters and craft artists is just holding steady at the 4-plus years of college level and above, and both years of graduate education and degrees are suspect due to changes in the coding procedures of the Census. According to the findings of the discrete surveys used here, over 40 percent of the painters/craft artists have graduate degrees.

Self-employment rose for both male and female painters and craft artists from 32 percent of males and 34 percent of females in 1970 to 47 percent of males and 49 percent of females in 1990. For females, as self-employment increased, unemployment declined, but the definition of self-employment for visual artists is a highly complex one.

Females continued to earn less than males in all sectors between 1970 and 1990, even though between 1980 and 1990, the female median income for professionals more than doubled to \$23,113, and the median income for female painters/craft

#### 4 | Artists in the Work Force

artists more than tripled to \$22,041. For female professionals who worked 50 to 52 weeks, median income was \$29,181. The median income for full-time female painters/craft artists of \$18,762 was lower than that of their artist counterparts, whose median income was \$20,825 in 1990.

In 1990 authors Jeffri and Greenblatt found that Census data showed a larger proportion of women as painters, sculptors, craft artists and artist printmakers, with fewer living in urban areas. They had a higher median income than all artists and the general labor force, but were closer in median age to professionals. For both males and females, the level of education, according to the Census, seemed to be just holding steady or rising slightly at the higher levels. More of these artists were self-employed, with percentages much higher than other kinds of artists. The median income for male painters and craft artists grew more slowly than for the total work force, male professionals and female painters/craft artists, whose median income tripled since 1980. Finally, it appeared to the authors that part-year female painters/craft artists earned more than their full-year counterparts.

The discrete surveys Jeffri and Greenblatt studied offered another view, one which targets the artist population more narrowly than the Census, and which suggests additional ways of looking at how artists view their occupations. These surveys also identify other areas of inquiry that broaden the picture of the artist in society. Neither the Census nor the discrete surveys purport to provide a longitudinal data base, a problem which the authors felt the National Endowment for the Arts should perhaps try to address for artists in the future. Finally, the authors concluded that research indicates the need for a regular survey of artists, if possible, by the NEA, which combines the more relevant aspects of the Census with other areas of inquiry, some of which they have identified in their report.

#### Performing Artists

Ann O. Kay and Stephyn G. W. Butcher found that the performing arts have become an increasingly important part of American life in recent decades, at least as measured by their growing presence. Between 1965 and 1992, the number of professional dance companies in this country leaped from 37 to more than 250, and their audience from 1 million to over 16 million. Professional nonprofit theatres expanded dramatically, with 1992's count of more than 400 theatres representing over seven times the number of theatres in 1965. Although Broadway and road shows employ proportionately fewer professional actors, resident theatres and other forms of professional theatres are expanding. As a percentage of total gross national product, the motion picture industry grew by one-third between 1969 and 1989, amusement and recreation services grew by half, and radio and television broadcasting increased by half. Meanwhile, the number of professional orchestras doubled, and opera companies grew fourfold since the mid-1960s.

From 1970 to 1990, performing artists as a group grew 50 percent faster than the national labor force and slightly faster than other professional occupations. The dancers and actors-directors occupations were among the fastest growing of all arts

occupations. By contrast, numbers for musicians-composers leveled off during the 1980s.

Union survey data have shown musicians are more likely than other performers to rely on income from jobs outside their arts profession. In 1980 only 26 percent of musicians received all of their income from performing arts work, as against 32 percent of actors and 62 percent of dancers.

Throughout the last two decades many performing artists could not find work in their profession. In 1990 when the national unemployment rate was 5.3 percent, the rate for actors and directors was 13 percent; for dancers, 7 percent, and for musicians and composers, 6 percent. During the 1970-90 period, performers' unemployment rates consistently exceeded the national average, but each performing arts occupation experienced its own unemployment trends. The rate for musicians and composers rose and fell over the 1970-90 period, mirroring the national unemployment trends. For actors and directors, unemployment held at approximately twice the national rate in 1980 and 1990. For dancers, however, unemployment moved down from nearly three times the national rate in 1970 to within two points of the national rate in 1990.

Though musicians and composers had somewhat lower rates of unemployment than other performers, those who were unemployed during 1990 were out of work longer than other performing artists. About one out of eight unemployed musicians and composers had been without a job for two to five years in 1990, about three times the rate for actors and directors and twice the rate for dancers. For all performing artists, though, long term unemployment continued to hamper the full utilization of this segment of the work force.

Survey findings from 1980 suggest that the labor reserve is further increased by the discouraged worker phenomenon; that is, by performing artists who leave the labor force because they believe no jobs are available. At least 5 percent of actors and musicians fit this category that year, with fewer dancers doing so.

Performers cycle more often between employment and unemployment than other workers. More than three out of five actors who had any unemployment in 1980 were out of work three or more periods, as were more than one out of two musicians and nearly one in three dancers.

Dancers were the performers least likely to work a full year. For those who worked anytime in 1989, their median number of weeks worked was 39, compared to 50 weeks for actors and directors and 48 for musicians and composers. The latter were most likely to report self-employment.

The principal industry employing performing artists continued to be the "theatres and motion pictures" industry, although during the 1980s the number of musicians in this industry declined. The industry in which actors showed the greatest growth (a 50-fold jump) during these two decades was in "radio and television broadcasting and cable."

Performers as a group increased their income levels over the 1970-90 period, but the gains were not equally shared. Actors and directors' median earnings in 1989 were \$22,000 according to Census data, up from about \$12,600 ten years earlier. Census

data also showed one-fourth of actors-directors earning less than \$10,000 in 1989. In contrast, union pension records, which look only at earnings in the acting profession, showed nearly nine out of ten actors receiving less than \$10,000 in 1990. This suggests the large extent to which actors must supplement their arts income with outside jobs.

Dancers' earnings tended to be the lowest in the performing arts. Although their median earnings grew from about \$5,400 to \$8,500 between 1979 and 1989, nearly a third of dancers earned less than \$5,000 in 1989. Their earnings did not keep up with inflation during the 1980s. Meanwhile, musicians and composers saw their median earnings rise from \$5,600 to \$9,900 between 1979 and 1989, and the proportion earning less than \$10,000 dropped by nearly a third.

Personal earnings levels from acting were extremely volatile, as union pension data show. One out of five actors who had paid work in their profession in 1990 did not have any acting income two years later. Half of those who had earnings received less than they did two years before. A few went from zero to \$60,000 or more in two years.

Earnings levels depended in part on the type of work performers did. Television work paid better for the members of one actors union, while theatrical engagements were most rewarding for union musicians.

Performing artists tended to cluster in the West and Northeast regions of the U. S., particularly in the New York and Los Angeles areas. Although they lived there to be close to the historic centers of performing arts employment, these areas also had the highest rates of unemployment for performers. As the number of performers grew during the last two decades, so did their geographic distribution. The relative increase in the performing artist work force in the South has been a significant geographic trend in these 20 years.

### **Architecture and Design Arts Occupations**

Harry Hillman Chartrand examined trends in architecture and design occupations for 1970-1990. His findings are summarized here.

First, architecture and design occupations grew significantly over the two decades covered by this report, representing 0.6 percent of the experienced labor force, 4.6 percent of all professional specialty workers and 45.2 percent of the arts labor force in 1990.

Second, architects, decorators and designers 25 to 44 years of age dominate their professions, accounting for more than 60 percent of those in the fields.

Third, both architecture and design were predominantly white professions (90.5 percent for both) in 1990. However, Hispanics grew from 1.8 percent of all architects in 1970 to 5.1 percent in 1990. During the same period, Afro-American architects increased from 2.4 percent of all architects to 2.8 percent and non-white and non-black architects, largely Asians, grew from 3 percent to 6.7 percent between 1970 and 1990.

Among decorators and designers, Hispanics grew from 2.9 percent of the profession in 1970 to 5.4 percent in 1990. Afro-Americans grew from 1.9 percent

in 1970 to 3.6 percent in 1990. Non-white and non-black decorators and designers grew from 2.1 percent in 1970 to 6.2 percent in 1990.

Fourth, by 1990 over half of all architects, designers and decorators lived in the South or West, with each of these regions home to approximately one-quarter of the groups. The Northeast and Midwest have lost their historic dominance of these professions.

Fifth, while architecture remained a predominantly male profession in 1990, women architects represented 17.7 percent of all architects then. By contrast, women decorators represented 73.3 percent and designers 43.5 percent in their fields in 1990.

Sixth, among architects, those with four or more years of college were 80.2 percent of the profession in 1990, increasing from 73.3 percent in 1970. Among all decorators and designers, 35.8 percent had four or more years of college in 1990, increasing from 21.6 percent in 1970.

Seventh, in 1970 self-employed architects represented 36.7 percent of the profession. Self-employment decreased to 32.8 percent by 1990. Meanwhile, self-employment among all decorators and designers increased from 15.9 percent in 1970 to 24.6 percent in 1990. Among architects, 25 percent worked part-time in 1990, compared to 42.8 percent of decorators and designers. The high level of part-timers among decorators and designers reflects a majority of women in these professions.

Over 75 percent of architects worked in professional services industries, i.e., in architectural firms. Over 75 percent of decorators and designers worked in manufacturing, retail trade or business and repairs service industries.

Eighth, in 1987 there were nearly 18,000 architectural establishments with receipts of almost \$10 billion and 137,000 paid employees. Over 70 percent of receipts came from projects involving commercial buildings or public and institutional facilities. Nearly 78 percent of receipts were for architectural services excluding landscape architecture and 75 percent of receipts were from industrial, business, and commercial companies, government and private institutions.

In 1987 there were 7,202 graphic arts establishments with receipts of \$3.2 billion. The Northeast accounted for 34 percent of receipts; the South, 17.5 percent; the Midwest, 25.5 percent and the West, 22.7 percent.

Ninth, the median annual household income of architects in 1989 was \$56,773, which was 140 percent of the labor force average, 109 percent of the typical professional specialty worker and 128 percent of the typical artist. The median annual income of a decorator and designer was \$45,873, or 113 percent of the labor force average, 88.2 percent of the typical professional specialty worker and 103 percent of the typical artist.

## Introduction

To understand how artists fared in the work force from 1970 to 1990 it is useful to contrast their employment experiences with those of other professionals with comparable education and training. This introduction will attempt to do this, identifying the labor force terms which appear throughout the four sections of this report and the areas of common ground covered by the various authors. It synthesizes to some extent key points from the sections which pertain to the overall report—points which individual authors explored thoroughly and which will be extracted to this section.

Any study of persons in the labor force must naturally define exactly who is to be included. For purposes of their analyses, the authors generally refer to the labor groups defined below. They also discuss in their individual sections various aspects of these groups as they relate most directly to the specific art fields being discussed.

- The *civilian labor force* includes all persons 16 years and older who are currently working (the employed), plus those not working but looking for work (the unemployed). Persons currently not working and not looking for work are described as *out of the labor force*. Working persons in the military are obviously excluded, also.
- The *experienced civilian labor force* (ECLF) consists of all employed and unemployed persons with recent civilian work experience (again excluding those in the military). This more narrowly defined term has been used in recent studies of artists commissioned by the NEA and will often appear in this report.
- *Professional specialty workers* (PSW) includes artists, athletes, astronomers, dentists, engineers, lawyers, miners, nurses, physicians, physicists, optometrists, reporters, social workers, among others.
- *All artists* include actors and directors, announcers, architects, authors, dancers, designers, musicians and composers, painters, sculptors, craft-artists and artist printmakers, photographers, teachers of art, drama and music in higher education, and also artists and related workers not elsewhere classified.

### Growth Rates in the Labor Force, 1970-1990

The experienced civilian labor force numbered 79,801,605 according to the 1970 U.S. Census of Population and Housing. About one in 100 of those, or 736,960, were artists. By 1980, the experienced labor force had increased by 30.4 percent to 104,057,985. Authors Ann Kay and Stephyn Butcher attribute this high growth rate to a continuing move into the labor force by the baby boom generation and an increased participation of women in the labor force. The number of artists jumped also, growing an average of 4.0 percent per year from 1970 to 1980, or 47.3 percent over the decade. This boom in artists' numbers occurred for the same reasons as the national labor force, plus a trend toward the increasing importance of

professional specialty occupations and the service sector in the U.S. economy—a trend that continued in the 1980s.

By 1990, the experienced labor force had grown to 122,473,499 and the artist labor force to 1,671,277 (see Tables 1 and 2 in the Performing Artists section). Professional specialty occupations also grew dramatically over the 1970-90 period, increasing from 8,800,210 workers in 1970 to 12,275,140 in 1980 and to 16,647,688 in 1990. The growth rate among artists during the 1980s exceeded that of the ECLF and PSW.

The U.S. labor force during the 1970 to 1990 period became better educated, more ethnically diverse and comprised of a higher percentage of women. Other general demographic trends among all the occupational groups discussed in this report include lower rates of marriage and household formation and a decline in the percentage of veterans.

### How the Census Classifies Artists

The authors of the report explained that all of the employment and earnings information available from the Census flows from the occupation in which the worker was classified. The work history (labor force status, weekly hours, weeks worked, income) becomes attached to that occupation.

The Census asks six basic questions about current or most recent job activity with instructions to describe the person's "chief job activity or business last week." Respondents who had more than one job were instructed to describe the one at which they worked the most hours. If they had no job last week, they should refer to their last job or business since 1985.

The six questions center on:

- Industry or Employer—employer, kind of business
- Occupation—kind of work, most important activities
- Organization ' Sector—private nonprofit, government, self-employed, working without pay.

The basic way artists (and others) get fitted into a category is by answering the requisite six questions, and Census bureau employees deciding into which category they fit based on a classification listing.

Several authors pointed out concerns over using Census data to analyze labor market outcomes of artists revolve around the manner in which occupations are defined. A person's choice of occupation is determined by his or her response to a request for information on work activity "last week." Further, occupation is self-defined; i.e., the respondent names the occupation, rather than picks the best available choice from a list. The Census then assigns the respondent's self-defined occupation to an existing classification (or creates a new one if warranted). Thus an occupational classification consists of a number of individual but related occupations.

The Census procedure forces the respondent to select one occupation only. Those who worked at more than one job during the reference week are required to choose only one—that at which the most time was spent during the week.

Authors Neil Alper and Gregory Wassall state that the use of Census data to analyze labor supply, incomes and other labor market characteristics of artists has been challenged by some social scientists with two principal criticisms: (1) that the Census defines the term “artist” too broadly, and (2) that the Census mis-classifies or ignores some artists because of frequent multiple job-holding in most artistic occupations.

The Census does not actually define the term “artist.” Rather, the 1980 and 1990 Census creates six broad occupational classifications including one called “Managerial and Professional Specialty Occupations” that contains all 11 Census artist occupations. The 11 categories are the product of the NEA, and are based on which occupations have traditionally comprised its artistic constituency. They are: (1) actors and directors, (2) announcers, (3) authors, (4) dancers, (5) designers, (6) musicians and composers, (7) painters, sculptors, craft-artists and artist printmakers, (8) photographers, (9) artists, performers, and related workers, not elsewhere classified, (10) architects (found under the category “Engineers, Architects, and Surveyors”), and (11) college and university art, drama, and music teachers (found under “Teachers, Postsecondary.”)

While some of the 11 categories may indeed be too broad (the artists not elsewhere classified category and dancers), others such as architects and radio and television announcer categories are sufficiently narrow.

A second limitation in using Census data discussed by several authors lies in its treatment of multiple job-holding. The Census questions force a respondent to choose only one occupation and the respondent’s labor market experiences for the previous calendar year are then attributed to that occupation. While this procedure is reasonable for most workers, who largely hold only one job, for artists it does not produce an accurate picture of work hours, earnings and other aspects of labor market behavior due to their extensive multiple job-holding.

Alper and Wassall present a case for using a more expansive definition of the work force in analyzing the labor market experiences of authors, and artists in general. Compared to members of most other professional occupations, artists are more often marginalized in the labor market. They often moonlight to make ends meet. In addition, career paths in the arts are rarely well defined. Young persons with artistic skills and training often find it hard to start an artistic career, either in terms of obtaining employment or in finding buyers for their work. Such artists would be excluded from the experienced civilian labor force, since they would be classified as being unemployed with no prior work experience, or out of the labor force. Other artists may be working on their art but unable to sell it, while being supported by a spouse or others. It is not obvious how they would describe themselves in the Census questionnaire, but they may also wind up classified as out of the labor force.

Such considerations are particularly relevant to artists struggling to join the artist labor force initially, to stay employed in it and to support themselves, with or without

holding multiple jobs. Compared to the general labor force where only 6.2 percent worked in two or more occupations in 1989, a large percentage of artists have to moonlight to survive.

### **Strengths and Limitations of Census Data**

Several of the authors of this report summarized the strengths of Census and other government research data on artist occupations:

- Data are consistent with and directly compatible with other occupations. Their use permits the drawing of comparisons among occupations.
- Data are collected at regular intervals permitting trend analysis and the drawing of comparisons over time.
- Large sample sizes lead to a comprehensive data base permitting detailed analysis.
- A broad picture displays central tendencies of the artist population.
- The data provide an answer to the question, "How many artists?"—a question often used by policy makers, funders and arts groups, particularly in times of scarce resources.

Census data report the overall labor market activities of artists. However, Census data sources have some limitations:

- The system of classification. Data are about primary occupation, i.e., where one works the most hours. Therefore, artists who work more time in jobs other than their art occupation are not classified as artists. Also, the Census classification system will make some artists appear more successful in their craft than they really are.
- Data are of limited usefulness in addressing questions specific to specialized artist groups.
- Data do not reflect certain labor market conditions for artists, i.e., artists who work at a different jobs simultaneously, or in more than one art form, or those for whom art making is only one of several careers. Thus data are unable to account for employment and earnings in secondary/multiple jobs which artists often have and which affect their economic welfare to the extent at times of keeping them above the poverty level.

### **Strengths and Limitations of Non-Census Data**

Each section of this report supplements Census data with information obtained from direct surveys of general and specific artist groups, and from professional organizations and industry records. While the Census is more comprehensive, these surveys are more detailed. Authors Joan Jeffri and Robert Greenblatt point out that some discrete surveys are also more attitudinally based than the Census, which some economists are beginning to acknowledge as important when studying economic

data on artists. Thus these other data have the indirect result of providing a forum for artists to advocate for themselves, plus indicating areas for further research.

Surveys analyzed in this report include studies based on general surveys of artists where a broad range of artistic occupations is targeted and the information collected is relevant to all artists. Also included are studies based on specialized surveys of a single artistic occupation. A third source of data is information provided by artists to a professional organization or union.

Harry Chartrand and other authors of this report summarized some of the advantages of these non-Census data sources:

- Data are on those generally accepted as "professional" in their field.
- Data are useful in addressing questions specific to such professionals.
- They provide valuable reference information since they offer comparable data for similar occupations.
- Questions geared to particular occupational groups yield answers that are more illustrative of the labor market experiences of that group. Chartrand and others also point out these disadvantages of non-Census data:
- Data are not necessarily compatible with other occupations.
- Data are not necessarily collected on a regular basis, limiting trend analysis.
- Surveys aimed at general artist groups may not truly represent the population of artists and are not likely to be as statistically reliable.
- Regarding use of union records, it is difficult to generalize the results to the artist labor force in general.

Comparing data from Census and non-Census sources cannot help but present a more complete portrait of artists in the labor force. Figures and percentages from such different data bases will not always agree, but despite these differences, each of the various data sources provides a unique view or insight into the conditions affecting the employment and earnings of artists.

The labor market for artists toward the close of the 20th century is challenging for those risk-loving individuals who balance "making it big" in the art world against perhaps not making it at all. The employment answer for many artists appears to be supplementing their volatile earnings in art endeavors with more predictable earnings from secondary jobs such as teaching.

Continuing research by the National Endowment for the Arts and others will further illuminate market conditions for those artists who—more than any other workers—shape today's culture.

NOTE: The following reports have been condensed from full-length statistical studies. The authors' original comprehensive documents are available in the Educational Research Information Center (ERIC) system. They may be accessed by use of these ERIC numbers for Chapters I, II, & III in the order of the chapters: ERIC #ED385856, ERIC # ED390728 and ERIC # ED390727. Chapter IV may be accessed by use of its full original title: Architecture and Design Arts Occupations 1940 to 1990.

# I. The Write Stuff: Employment and Earnings of Authors 1970 to 1990

by Neil O. Alper and Gregory H. Wassall

## Overview

Successful authors are frequently in the news. Winners of the major prizes for writing receive extensive press coverage. Best selling authors make public appearances on television, at book signings and readings in book stores. Those authors, including television and film scriptwriters, fortunate enough to command top money, are especially newsworthy. One example reported in the Los Angeles Times is the \$18.9 million paid author Dean Koontz by publisher Alfred A. Knopf for a three-book contract. Two film scripts that sold for \$4 million apiece also raised some eyebrows. Given the media interest and public attention that prominent writers enjoy, surprisingly little statistical information about them reaches social scientists, policy analysts, policy makers or writers themselves.

The National Endowment for the Arts (NEA) commissioned this report as part of its research on employment and earnings of artists in the labor force. The NEA supports research on the artist work force in general and also shows a special interest in writers through its Literature Program which has aided writers with fellowships and other means.

This report surveys and synthesizes current knowledge on the employment and earnings of authors between 1970 and 1990, compiling and comparing statistics on how they go about making a living, including second occupations, and how successful their efforts are. The information comes largely from the U.S. Census and other government censuses, surveys of authors and from records of writers' unions and professional organizations. It is hoped that by consolidating information from diverse sources some sense may be made of the writing profession. In comparing statistics among surveys and censuses, the diversity in definitions, sampling procedures and sample sizes should be noted.

The U.S. Census, listing about 107,000 American authors, is the most comprehensive source of information about them in the country. As mentioned in the general introduction to this report, it affords several advantages in studying the labor market experiences of artists, and also has some shortcomings. Because the Census requires every worker to declare only one occupation, all work experiences and earnings in a given year are attributed to that occupation. For authors and many other artists, this leads to an overstatement of earnings from their craft, because direct surveys have turned up significant percentages working in other occupations in a given year.

Sources of information about authors which deal with multiple-job holding among occupations include the annual Current Population Survey. Surveys specifically aimed at writers give more detail about personal characteristics, working conditions and earnings. Records of authors' unions and professional organizations offer little personal information, and often provide data only on sources of income through union recognized activity.

The author profession as treated in this work embraces poetry, fiction and creative nonfiction, in English or in translation. Census statistics used here, unless otherwise noted, are drawn from the broadest definition of authors and related professionals: all persons who indicated occupational membership, regardless of whether they were in the labor force at the time of the Census. In 1990, 14 percent of authors indicated occupational affiliation, despite not being members of the labor force (neither working nor actively seeking work).

## Profile of American Authors

The author occupation is growing rapidly. Between 1970 and 1990 their numbers increased by 285 percent, with half of this phenomenal growth occurring between 1985 and 1990. Nevertheless, authors still constitute a very small fraction of the nation's labor force, or nine in 10,000 in 1990.

Relative to the entire labor force, authors are concentrated in states along the Atlantic and Pacific coasts, although this concentration lessened somewhat from 1970 to 1990. California and New York are home to more authors than other states and have the highest percentage of authors in their labor force. The Los Angeles and New York City metropolitan areas have the highest percentages of authors in their labor forces, and the greatest number of authors, of any metropolitan areas in the country.

Members of the author profession are well educated. In 1990 they averaged 15.8 years of education, more than other artists and other professional and technical workers. They are also older; their average age of 44 years exceeded that of artists by five years and that of other professional and technical workers by four years. In 1990 half of all authors were men and 95 percent were white. These percentages were higher than those of other professional and technical workers. Over the 1970 to 1990 period the author profession had a lower percentage of minorities than artists or other professional and technical occupations. It contained more women than did the artist profession, but fewer than did the other reference groups.

Authors had higher rates of unemployment than other professional and technical workers, but lower rates than other artists. In 1990 only 40 percent of authors worked full-time year-round (working at least 35 hours per week and 50 weeks per year). By comparison, 46 percent of artists and 56 percent of other professional and technical workers worked full-time.

Compared to the average artist and professional/technical worker, authors were far more likely to be self-employed, and less likely to work for private sector employers. Therefore, authors received a higher percentage of their earnings from

self-employment, although these earnings still were typically less than half of authors' total earnings. In 1989 authors' total earnings were \$23,335. (Earnings and income data are annual averages, and refer to the year prior to the Census.) In both 1979 and 1989 authors earned less than other professional and technical workers, and less than editors, reporters and technical writers. In 1969 and 1989 they earned more than other artists.

Because authors worked fewer hours per year than members of the other reference occupations, their computed hourly wage is higher than that of the other reference groups in all three Census years. Census data also show that authors' total personal incomes are higher than those of all artists, but lower (except in 1969) than those of other professional and technical workers. The average total personal income of authors in 1989 was \$30,089, while their average total household income was \$62,083.

Between 1969 and 1989 the earnings of authors grew by 175 percent. However, this earnings growth lagged behind that of the other reference occupations, and behind changes in the Consumer Price Index. In constant 1969 dollars, the real earnings of authors fell by \$1,567. The earnings of other reference groups, except for the professional and technical workers, also fell over this period.

Similar trends were found in total personal income. Between 1969 and 1989 real personal income of authors fell by \$924. Real personal incomes of the reference groups fell also, except for other professional/technical workers. Authors' household income, however, outpaced inflation, rising by \$2,370. All reference occupations showed increases in real household income, resulting primarily from the rising labor force participation of women over this period.

One interesting characteristic of authors' earnings is their relative inequality. In 1989 more authors had zero or negative earnings, and more earned over \$90,000 than any of the reference groups. Essentially the same earnings distribution, relative to the other occupations, was found in 1979 and 1969.

The same array of statistics was examined for authors in the experienced civilian labor force, and for authors who worked full-time year round. Authors in the experienced civilian labor force earned \$25,800 in 1989, or \$2,465 more than all Census authors (i.e., including authors out of the labor force in 1990). Other occupations, when limited to labor force members, experienced comparable earnings increases. Personal and household income rankings did not change either. The average personal income of authors in the experienced civilian labor force in 1989 was \$31,788; their average household income was \$63,019.

Comparing only authors and members of other professions who work full-time year-round minimizes earnings differences caused solely by different amounts of time worked per year. Authors, as mentioned, worked fewer hours per year. As a result, the annual earnings of full-time authors compare more favorably to their counterparts in other occupations. For example, in 1989 full-time authors' earnings of \$35,896 placed them above artists, editors, reporters and technical writers, and below only other professional and technical workers.

Differences in earnings and income by gender, race and ethnicity were also examined. Given the small size of the author profession and the relatively small percentage of minorities working as authors, racial and ethnic comparisons were made only among white, black and Hispanic authors. In all three Census years, significant disparities between the average earnings of men and women authors were found. The earnings disparity narrowed between 1969 and 1989, but still remained significant. In 1989 women's earnings were only 52 percent of men's. Differences in median earnings and wages were smaller, indicating more men were concentrated in the high earnings and hourly wage region. Gender differences in personal and household incomes were smaller. In fact, women authors had higher household income.

Differences in earnings among white, black and Hispanic authors were smaller. In 1989 black authors' earnings were 91 percent of white authors' earnings, and Hispanic authors' earnings were 87 percent. Greater disparities appeared in personal income and household income between white and minority authors. The ratio of black to white authors' personal income was 85 percent, and the ratio of Hispanic to white authors' personal income was 80 percent.

### **Evidence on Authors' Multiple Job Holding**

The Census Bureau's Current Population Survey, even with its small sample size, consistently found high multiple job holding rates for authors and artists. From the mid-1980s to the early 1990s moonlighting rates for authors exceeded all other professional workers. In 1991 the rate for authors was double that of all artists, almost three times that of all other professionals and almost four times the rate of the total work force.

Evidence from non-census surveys of authors, or artists including authors, confirms that writers' labor market behavior in a given year involves working at more than one job. Alper-Wassall's survey of New England artists, undertaken in 1981-82, found that only one in five authors worked full time at writing, and the majority worked in a job related to their writing some time during the year, primarily teaching. Additionally, 45 percent held jobs unrelated to their writing. The evidence shows several of these work activities were done simultaneously.

Columbia University's Research Center for Arts and Culture survey undertaken in 1989 found that 90 percent of the writers needed to work at some non-writing job to support their writing, and that almost half were multiple job holders at the time they were surveyed. Similar behavior was identified in the Columbia Survey of American Authors done for the Authors' Guild in 1979. It found that 70 percent of authors had earnings from non-writing work, and that almost half held regular salaried positions not as writers. Like the other studies, it found that the majority (90 percent) of those who had second jobs held professional job, not the traditional service or clerical jobs of the stereotypical "starving artist."

Surveys of authors in other countries suggest that multiple job holding for writers is not a uniquely U.S. phenomenon. A study of the members of the British Society of Authors and the Writers' Guild found that only 17 percent of authors

worked only as writers, and that 67 percent of those surveyed identified writing as a secondary occupation. A French study found that 30 percent of the authors worked at another trade during the survey year, and that 70 percent had done so at some time during their writing career. In Finland, only 22 percent of the authors indicated that they were full-time writers, and fully half indicated a non-writing occupation for tax purposes.

The importance of authors' moonlighting activity is best determined by examining its impact on their economic well-being. Alper-Wassall found that two-thirds of the authors' labor market earnings and almost 60 percent of their total income comes from working in a non-writing job. The Columbia Research Center's study data suggests that non-writing income, labor and non-labor income combined account for almost 80 percent of total writers' income. Columbia's study for the Authors' Guild reported that median writing income comprised 33 percent of median total personal income, and for the group most dedicated to writing—the "committed full-timers"—writing income was only 77 percent of total income. Without their other jobs that are often held concurrently with their writing work, clearly the economic well-being of authors would be much worse, and most writers would be classified as poor.

### **Evidence on Authors from Non-Census Sources**

The value of non-census surveys goes beyond their ability to examine the rather unique labor market behavior of authors and other artists. Following is a summary of additional findings from the three surveys already discussed and three studies utilizing the administrative records of the Writers' Guild of America, west, a union for writers in the television, radio and film industries.

Demographic characteristics of authors follow a generally consistent pattern across all the studies. Authors are primarily white with an average age around 40 years. The proportion of non-white seems to be increasing. The two earliest studies (Columbia's Authors' Guild and Alper-Wassall) found approximately 3 percent non-white authors. The later survey (Columbia's Research Center) found almost 10 percent non-white, and the union's administrative records showed almost double the number of minority members from 1986 to 1991.

The gender composition of the profession appears to be changing as well. The earliest study found 60 percent of the authors were female. Alper-Wassall found an even distribution, and the latest survey (Columbia's Research Center) found 60 percent female writers. The union's administrative records suggest an increase in female writers employed from 1982, but they accounted for only 22 percent of employed writers in 1991.

Writers, like their artistic colleagues, are very well-educated compared with the general population—a consistent finding for all the surveys. Alper-Wassall found they were better educated than both performers and visual artists. They were also found, by both Alper-Wassall and Columbia's Research Center, to have started their training to be writers about age 16, which is considerably older than performers, but about the same as visual artists.

Two of the surveys, Columbia's Authors' Guild study and Alper-Wassall, found the income of other family members to be important in explaining the ability of writers to work at their craft, and that family income for the writers was well above the poverty thresholds at the time of the surveys.

An additional impact on writers' economic well-being is the cost they incur to write. Alper-Wassall found that writing earnings net of costs averaged half of the writing earnings, and that median writing earnings net of costs were negative. Columbia's Research Center's findings were similar, showing that only about 43 percent of the authors had writing income that exceeded their costs.

Female authors were found to consistently earn less than male authors. Columbia's Authors' Guild study showed female authors' median earnings from writing to be 77 percent of the male median. This was a considerably smaller difference than the Alper-Wassall finding where female authors' average earnings from their writing were only 20 percent of their male colleagues' earnings. When adjustments were made for the fact that women spent much less time writing during the year, Alper-Wassall's estimated differential for hourly wage was that women writers earned about 40 percent of male earnings. The three Writers' Guild studies identified differentials more in line with the Authors' Guild study, and found the earnings to fluctuate over time. In 1982 median female earnings were 73 percent of male earnings. In 1986 they were about 60 percent of male earnings and in 1991 they were about 75 percent of male earnings.

Considerable differences exist in earnings related to the type of writing the author does and for whom they work, according to findings by the Columbia's Authors' Guild study and the Writers' Guild studies. The Authors' Guild study found that poets earn the least from their writing, authors of academically oriented nonfiction were slightly better off, children's books writers and writers of general adult fiction were in the middle, and writers of "genre" fiction earned the most. The Writers' Guild studies found that writers in television tended to earn more than writers in film, but the difference narrowed over the decade of the studies to a difference of only 3 percent in 1991. Greater disparities were found in earnings based on the type of firm the writer worked for, regardless of whether it was in television or film. Writers who worked for the major television or film production companies earned considerably more. In 1991, for example, writers working for the major film producers had median earnings 115 percent higher than their colleagues working for the smaller independent film producers.

## Authors in the U. S. Census, 1970 to 1990

This section presents and analyzes evidence on the employment, earnings, labor market and other related characteristics of authors using information in the 1970, 1980 and 1990 U. S. Census. The evidence is presented separately for men, women, white, black and Hispanic authors. It compares authors to all artists, using the definition of artist employed by the National Endowment for the Arts. Included in the Census definition are: (1) actors and directors, (2) announcers, (3) authors, (4)

dancers, (5) designers, (6) musicians and composers, (7) painters, sculptors, craft-artists and artist printmakers, (8) photographers, and (9) artists, performers and related workers, not elsewhere classified. The following Census occupations have been added by the NEA: (10) architects, and (11) college and university art, drama and music teachers. Secondly, authors are compared to all professional and technical workers, excluding artists, and members of several other occupations, including two with similar characteristics to authors: editors and reporters, and technical writers.

### **Census Data Used to Analyze Authors' Work Experiences**

Most of the information reported on in this section is derived from the 1970, 1980 and 1990 Census Public Use Microdata Samples (often simply called PUMS). Each contains a sample of the responses from households who completed the Census long form questionnaire. A minority of households are asked to complete the long form, approximately 16 percent of all households in the 1990 Census. The 1990 long form contained 26 housing questions and 33 personal questions.

The PUMS is unique in that the unit of observation is the household and person record. Because information about individuals is revealed, several steps are taken to insure anonymity, including less detail about geographic location than is available in other Census releases which use aggregated data, typically over geographical areas.

Since the inception of PUMS in 1940, the Census Bureau has extracted different sized samples for researchers to work with, determined somewhat by the ability of existing computer systems to store and process the data. In 1980 and 1990, a basic five percent sample and a supplemental one percent sample were drawn. The supplemental samples are focused on different geographic information (states, county groups and neighborhoods), or different segments, such as the elderly population. Or in 1990, for example, the supplemental one percent sample, like the five percent sample, was based on a random selection of respondents who completed the long form questionnaire.

The principal advantages of using Census Public Use Microdata are noted here. First, the Census sampling and information collection and tabulation procedures are very sophisticated; information gained in the PUMS can be generalized to the entire population with relatively small margins of error. Second, samples are large, permitting analyses of small occupations such as artists, and within that category, authors, for example. Third, vast information is obtained from the Census due to the wide variety of questions asked on the long form. Fourth, the Census provides consistent observations on a large sample of the population every ten years, enabling many types of comparisons over time.

### **Issues in Using Census Data to Analyze Authors' Labor Force**

Controversies over the use of Census data to analyze labor market outcomes of artists are discussed in the general introduction to this report, so only those particularly relevant to authors will be treated here.

To summarize: The Census classification system will make authors and several other types of artists appear to be more successful *in their chosen occupation* than they actually are. Despite this, it reports their overall labor market activities accurately.

Since the Census procedure permits individuals to describe their occupations, every type of author or writer may be found in the Census PUMS. However, not every author or writer is found in the authors occupational category. All occupations which were included in the authors category between 1970 and 1990 are listed below:

|                   |                     |                             |
|-------------------|---------------------|-----------------------------|
| Author            | Librettist          | Scenario writer             |
| Biographer        | Literary writer     | Scientific writer           |
| Continuity man    | Lyricist            | Screen writer               |
| Continuity writer | Magazine writer     | Script writer               |
| Dramatist         | Manual writer       | Short story writer          |
| Fiction writer    | Novelist            | Special writer              |
| Free-lance writer | Play writer         | Speech writer               |
| Gag writer        | Playwright          | Story writer                |
| Game author       | Poet                | Television script writer    |
| Ghost writer      | Poetess             | Television writer           |
| Handbook writer   | Professional writer | Verse writer-greeting cards |
| Humorist          | Program writer      | Writer not specified        |
| Lexicographer     | Radio script writer |                             |

The authors category includes all writers of fiction and many other types of writer as well. The Census does not provide the relative distribution of persons across these occupations.

Writers are also found in other Census occupation categories. For example, a sampling of listings within the editors and reporters category reveals (in 1990) advertising copy writer, columnist, art critic, book critic, copy writer, editorial writer, feature writer, literary writer, news writer and sports writer. Similarly, the technical writers category contains writers in the fields of engineering, health and science, plus specialists in documentation and technical writing. Technical writers became an occupational category in 1980; prior to 1980, they were included in the artists, performers and related workers not elsewhere classified. In 1990, the latter category contained among its unique potpourri of occupations a few at the very fringes of the writing profession, such as crossword puzzle maker and language translator. One might conclude that the author occupational category, if viewed as encompassing all "creative" writing, could be construed as too broad. On the other hand, if viewed as encompassing all those who earn their living from writing, it could be construed as too narrow.

As discussed in the general introduction to this report, most studies of persons in the labor force use the *civilian labor force* as their baseline definition. A variant of this definition—the *experienced civilian labor force*—includes all persons not in the military who are working, but only those unemployed persons who have had recent prior work experience. In the section immediately following, the size and geographic and industrial distribution of authors in the experienced civilian labor force are examined.

However, compelling arguments also favor analyzing the labor market experiences of authors and other artists, using a more expansive definition of the work force. There are numerous anecdotal examples of struggling writers whose status would officially place them either out of the labor force or as members of other occupations for extended periods in their careers. Fortunately, the Census permits the use of a more expansive definition. It includes all persons who call themselves authors in the Census PUMS, regardless of labor market status or work experience. These persons will be called *all Census authors*.

In light of these considerations, the rest of this part of the report uses three different definitions of the author profession: *authors in the experienced civilian labor force*, *all Census authors* and *full-time year-round authors* (those who worked at least 35 hours per week and 50 weeks per year). In the next section (see Tables 1 through 4), information on the size and growth of the profession and on industry and locational preferences of authors is presented for those authors who are members of the civilian labor force. In the remainder of the section (including Tables 5 through 16), where characteristics of the representative author are presented and compared to counterparts in the reference occupational groups, the all Census authors definition is used.

Looking at all Census authors makes writers, as well as all artists, appear slightly less successful relative to other professional and technical workers for three reasons: (1) a slightly higher percentage of all Census authors is found in the out of the labor force category; (2) a higher percentage of authors in the experienced civilian labor

force is unemployed; and (3) a lower percentage of working authors holds full-time employment. Looking at only those authors in the experienced civilian labor force has a similar effect, since reasons (2) and (3) still apply. If one's objective is to compare authors to members of other occupations when they share the same job status, perhaps the best choice is to compare the labor market experiences of only full-time, year round workers in each profession (those who worked at least 35 hours per week and 50 weeks per year).

### Growth in the Author Profession and Where Writers Work

The growth in the author profession over the 1970-90 period was exceptional and erratic. Authors in the experienced civilian labor force grew more rapidly than any other artist class, at an astonishing rate of 285 percent over this period, numbering 106,730 by 1990. The most dramatic growth was between 1985 and 1990 when the number of authors roughly doubled (Table 1). Table 2 shows the regional distribution of authors in the 1970-90 Census years. The nine-region breakdown in this table is commonly used in geographic displays of Census data.

| TABLE 1   |            |             |             |             |
|---|------------|-------------|-------------|-------------|
| NUMBERS OF AUTHORS IN THE EXPERIENCED CIVILIAN LABOR FORCE, COMPARED TO (1) ARTISTS, (2) PROFESSIONALS, AND (3) ALL WORKERS, 1970 TO 1990         |            |             |             |             |
| CATEGORY  | 1970       | 1980        | 1990        | GROWTH RATE |
| Authors   | 27,752     | 45,748      | 106,730     | 284.6%      |
| Artists   | 736,960    | 1,085,693   | 1,671,278   | 126.8%      |

In 1980 and 1990 the Pacific region, dominated by California, contained the most authors. In 1970 this region was second in number of authors to the Mid-Atlantic (including New York), which in turn came in second in 1980 and 1990. The Pacific region, however, ranked third in the rate of growth of authors over the 20-year period. The Mountain region had the highest rate of growth, closely followed by the West South Central region. The Mid-Atlantic had the slowest growth in authors, closely followed by New England. Larger regions naturally tend to be home to more authors, but differences exist between authors and all members of the labor force, both in terms of where they are located and of relative regional growth.

Location quotients are used to show regional concentration, usually of industries or of workers. Here a location quotient is used to show occupational concentration, the percentage of authors who reside in a region divided by the percentage of the

entire labor force which resides in the region. For example, a location quotient greater than one will be found in a region in which a larger percentage of the author labor force resides than of the overall labor force. A location quotient of exactly one implies identical shares of the author and the total labor force in a region. For any occupation, the entire country must have a location quotient of one.

How this plays out among the nine Census regions can be seen in Table 2. The two regions with the greatest endowment of authors relative to the entire labor force have rather consistently been the Pacific and the Mid-Atlantic. However, there has been a gradual trend toward a geographic distribution of authors more closely aligned with the distribution of the entire labor force. This is shown by the convergence of the regional location quotients toward one. Most notable in this convergence process is New England, which in 1970 had the highest concentration of authors. Its location quotient is now almost one.

More detail on author residence can be seen at the state level. Table 3 shows the ten states in which the most authors resided in the three Census years. These top ten states have been home to roughly two-thirds of all authors in the labor force in each Census year, regardless of their identity and ranking. California ranked first in author residence in 1980 and 1990, but second to New York in 1970. Washington joined the top ten ranking in 1990. Other states ascending the rankings are Texas, rising from ninth in 1970 to third in 1990, and Florida, rising from eleventh in 1970 to fifth in 1990.

| TABLE 3   |                |                |                |

| <b>SOURCE:</b> Ellis and Beresford, <i>Trends in Artist Occupations, 1970-1990</i><br>(Washington: National Endowment for the Arts, 1994), Table 5. |                |                |                |

Another way to look at the distribution of authors among states is to examine their percentages in each state's experienced civilian labor force, where the ten states with the highest percentage of author to total employment are ranked. The top ten states in this ranking are New York, California, Vermont, New Mexico, Virginia, Massachusetts, Colorado, Connecticut, Washington and Alaska. New York and California top both state rankings, and may well be special cases, with their concentrations of radio, television, film, publishing and advertising industries. Many, if not all of the ten states in this ranking are high "quality of life" states where people with no constraints on where they can live would be likely to locate. Prime examples are Vermont and New Mexico.

### For Whom Authors Work: Distribution by Industry

When authors in the experienced civilian labor force are split into the ten broad industry groups derived from the Census, 65.9 percent of authors are found in

Professional and Related Services. In 1990 only Construction and Manufacturing also contained more than 10 percent of the total. Because most industry groups contain a large number of industries, it is more enlightening to examine which specific industries employ the most authors. Table 4 shows that Miscellaneous Professional Services employed 52.2 percent of all authors in 1990. All other industries held no more than 7 percent of author employment in each Census year. The top ten industries combined employed 80.8 percent of all authors in 1990. Of the top ten industries in 1990, nine were also in the top ten in 1980, but only four were among the ten largest in 1970.

| TABLE 4  |           |           |           |

### Demographic Characteristics of Authors

The information that follows incorporates everyone who identified himself or herself as an author in the Census, regardless of being in the experienced civilian labor force at Census time. Therefore it includes (1) those who were unemployed with no prior work experience, (2) those claiming an occupation but who are out of the labor force, and (3) those employed by the military. By changing to the more inclusive all Census authors description from the experienced civilian labor force description, the number of authors covered increased significantly.

Basic demographic characteristics of all Census authors in 1970-90 are shown in Tables 5 through 8. Tables 5 and 6 show detailed characteristics of all authors, and then of selected reference groups: all artists (including authors), all professional and technical workers other than artists, and the two closely related job categories: editors and reporters and technical writers. Tables 7 and 8 reproduce the same characteristics of all authors, and then of male, female, white, black and Hispanic authors.<sup>2</sup>

| TABLE 5   |         |         |                   |                     |                   |

| SOURCE: Authors' tabulations from the 1970 Census PUMS.                               |         |         |                   |                     |                   |

In 1990, the average Census author was 44 years old, and had completed just under 16 years of education. Thus it is not surprising to discover that 43 percent of all authors held a bachelor's degree. An additional 21 percent had master's degrees. Of the authors in the 1990 Census, 57 percent were married and heads of their households, 50 percent were women, 95 percent were white, 3 percent were black and one percent was Hispanic.

Most demographic trends found in the overall population and labor force have parallels in the author labor force from 1970 to 1990. The U. S. labor force has become better educated, more ethnically diverse and comprised of a higher percentage of women. Other general demographic trends observed in all the occupational groups profiled in Table 5 and 6 include lower rates of marriage and household formation and a decline in the percentage of veterans.

The conventional wisdom in the United States would probably regard authors as being very similar to other artists, but authors' demographics differ in many ways from those of artists. With respect to education, authors more closely resembled

other professional and technical workers from 1970 to 1990. However, their level of education exceeded that of all artists by about one-and-a-half years. In 1990 authors held more of every type of college degree than all artists, and held more bachelor's, master's and doctor's degrees than other professional and technical workers. Authors had consistently higher rates of marriage and heading households than artists, explained perhaps by their averaging four to seven years older than artists. This age differential reflects both later entry and greater longevity in the occupation. It narrowed somewhat in 1990, due probably to many new, younger entrants to the profession.

In other respects, authors differ from both artists and other professional and technical workers. As noted, authors in every period are older than both groups. Persons with work-affecting disabilities consistently form a higher percentage of the author labor force than of the other groups, due to the relatively minimal physical demands required by writing. The typical author is more likely to be a woman than is the typical artist, but less likely to be a woman than the typical professional/technical worker. The typical author is less likely to be a member of a

racial minority or to be a Hispanic than either reference group members. Thus no numerical evidence in the Census reflects the increasing popularity of African-American and Hispanic writers that has occurred in the United States in the 1980s and 1990s. The percentage of these two groups in the author labor force actually declined in those decades.

The two groups, editors and reporters and technical writers, appear similar to authors, although the age in both has been consistently younger. Educational attainment is similar, but some race and gender differences exist. Compared to authors, in each Census year editors and reporters have had a higher percentage of women and technical writers a lower percentage of women. Both reference groups have had a higher percentage of racial and ethnic minorities in their ranks in each Census year.

Data on authors who are also members of the experienced civilian labor force show essentially the same picture and will not be treated in detail here. Generally, authors in the civilian labor force are younger, better educated, more likely to be married and heads of households and less likely to be women. In 1970 and 1980 they were more likely to be white. In 1990 the percent of white and black were essentially the same. Comparable differences exist between all Census artists and artists in the civilian labor force, and apply to professional and technical workers as well.

Authors who work full-time year-round are a much smaller group, constituting 39.7 percent of all Census authors and 46.4 percent of authors in the experienced civilian labor force. Full-time authors had somewhat more education, were 41 percent women, and a larger percentage belonged to racial and ethnic minorities.

The demographic characteristics of authors over the 1970-90 period, broken into gender, race and ethnicity are shown in Tables 7 and 8. Over all three Census years, white authors were older and had completed more formal education than minority authors. Male authors in 1980 and 1990 were older and possessed more formal education with a higher percentage of men writers possessing professional and doctoral degrees. More women writers possessed bachelor's and master's degrees. In general, a higher percentage of white writers possessed bachelor's and higher degrees than minority writers, with the exception of Hispanic writers.

### Authors in the Labor Market

In this section a variety of characteristics relating to the labor market status of authors and their reference groups is examined. Tables 9-10 present information on authors versus the selected reference groups for 1970-90. Tables 11 and 12 focus on labor market characteristics over the 20-year period by gender, race and ethnicity rather than by reference groups.

Several important points should be kept in mind relating to how this information was collected. First, questions on labor market experiences may refer to the Census year or to the prior year, depending on the reported activity in which the respondent was engaged in during the reference week. Other statistics provided in these tables, such as full-time, year-round status and average hours and weeks worked, refer to work experience in the prior year, since these statistics are based on

a calendar year's labor market experience. Also, for persons such as authors for whom moonlighting is common, the labor market data—especially the annual data—is likely to reflect time spent and experience in non-author jobs as well.

A labor market snapshot of authors in 1990 shows that 2.7 percent experienced unemployment during the reference week and 14.1 percent were neither working nor unemployed (out of the labor force). From 1970-90 authors had consistently lower rates of unemployment than all artists, but consistently higher rates (1.5 times greater) than other professional and technical workers. However, author unemployment rates over the 20-year period were roughly comparable to those of editors and reporters and technical writers, and in 1990 authors had lower rates.<sup>4</sup> Since 1980 authors have been more likely to be found out of the labor force than either of the other groups, and than other professional and technical workers in general.

Regarding the frequency and duration of employment, in 1990, roughly the same percentage of authors as other professional and technical workers worked at some time during the Census year. A greater difference (3 percentage points) exists in the percentage actually working during the reference week, suggesting that relatively more authors drift in and out of employment in a given year than other professionals.

In 1980 and 1990 authors worked fewer weeks and fewer hours per year than all artists, and fewer authors worked full-time year-round, due most likely to the much higher rates of self-employment in the author profession. However, this higher rate of self-employment for authors does not account for why other professional and technical workers continually experience less unemployment than authors. The difference in unemployment is more likely explained by these characteristics shared by other artists: Few or no entry barriers to the profession, less stability in existing jobs, frequent new jobs and assignments, changes in jobs and extended periods of no work.

Among all Census authors in 1990, besides the 58 percent who reported self-employment, 8 percent reported working for government and 32 percent reported working for private sector employers. Authors differ from other professional and technical workers in their low percent of government employment.

Authors in the experienced civilian labor force were found to have higher rates of both employment and unemployment rates than all Census authors. Members of the experienced civilian labor force by definition can only be working or unemployed; they cannot be out of the labor force. By contrast, all Census authors can be out of the labor force. In comparing all Census authors to full-time year-round authors, rates of unemployment and of absence from the labor force in the Census year are naturally lower among persons who worked full-time the entire previous year. However, full-time authors were less likely to be self-employed (46.1 percent vs. 58.0 percent for all Census authors in 1990). The comparisons among authors by gender, race and ethnicity in Tables 11 and 12 generally reflect differences found in the labor force as a whole. Men were more likely to be employed than women, and less likely to be out of the labor force. A significantly higher percentage of men worked full-time in all three years (57.6 percent men versus 49.4 percent for

women in 1990). However, in 1980 and 1990 both black and Hispanic authors were more likely to be full-time than white authors. Also, in both years the percentages of blacks and Hispanic authors working for any level of government are two to three times those of whites. Most of this differential is made up by lower rates of self-employment among minority authors, as it is hard to imagine many full-time jobs in government as authors. This choice in turn may reflect greater difficulties among minorities in "making it" as full-time independent writers.

### Earnings of Authors

This section examines how authors have fared economically over the 1970-90 period. Earnings and other sources of income to authors are reported and compared to earnings of reference occupations. The term *earnings* refers to income from work effort, either in the form of wages and salaries or earnings from self-employment. Census data on earnings, as noted above, are attributed to one occupation—that which the respondent identifies as the "chief job activity or business last week." Thus this information does not distinguish earnings of authors received from writing or from earnings received in other lines of work. Surveys of authors discussed in the next section of this report consistently report that a low percentage of total earnings is derived from writing.

\*1989. SOURCE: Authors' tabulations from the 1990 Census PUMS.

The Census provides separate categories for wages and salaries and self-employment. The latter category is further broken into non-farm and farm components. Only the non-farm component is reported here in self-employment earnings. For authors (and the reference groups discussed) farm earnings are minimal, and clearly cannot be from writing. Nevertheless, for the sake of completeness, total earnings reported include all wage, salary and self-employment earnings, including farm.

Successful authors may command earnings not only from writing, but may receive royalties from published work. Such royalties are included here in a category called asset income which also includes interest, dividend and net rental income. Asset income can only roughly measure actual royalty income received by authors. By comparison, little or no royalty income is earned by non-authors, so all else being equal, authors should receive greater amounts of asset income."

A wage rate is also calculated and reported here. This is defined as total earnings from work divided by total hours worked. Several of the income entries from the 1970 and 1980 Census that are reported in the tables below were calculated by the authors of this report. One of these—that of total earnings—was done out of necessity, because it was not a separate category until the 1990 Census. Two other calculations—of total personal income and total household income—were made to minimize the adverse effects of the Census practice of capping income categories' to

preserve anonymity. In 1990, for example, the Census capped each income category at different levels, which were determined by the earnings distribution in each category. Total personal income was capped at \$284,000, but asset income was capped at \$40,000.

In Tables 13 and 14 the earnings and incomes of all Census authors are compared to all Census artists and other professional and technical workers over the 1970-1990 period. The actual year in which earnings and incomes were recorded was the year prior to the Census, since all earnings and income data are annual averages.

In Tables 13 through 16 mean (average) values are reported first. Median (midpoint) values are reported in parentheses below the mean values. Means, rather than medians, are discussed below because many of the categories reported on have more than half the sample reporting zero earnings. In such cases, the mean provides more useful information than the median, which is zero. A comparison of means and medians is helpful in interpreting some of the differences in earnings found among occupations. As one example, the ratio of the mean to the median is later used as a measure of earnings variability.

In 1989, the average total earnings of all Census authors were \$23,335. These earnings were about \$2,100 more than the average earnings of all artists, but almost \$4,800 less than the average earnings of all other professional and technical workers. Editors and reporters and technical writers also earned more than authors, by \$1,600 and \$4,700 respectively. A higher percentage of authors' earnings was derived from self-employment than from the reference groups.

Comparisons among occupational groups over the Census years reveal that only in 1969 did authors earn more than other professional and technical workers, and more than editors and reporters. Since 1979, the first year for which this information is available, technical writers have also earned more than authors. In all three years all artists' earnings were less than those of other professional and technical workers. In 1979 only, artists' earnings were greater than authors' by about \$200.<sup>8</sup>

Authors' earnings grew at a relatively slow rate (175 percent) between 1969 and 1979, lagging behind those of the reference groups (205 percent for artists, 226 percent for editors and reporters, and 261 percent for other professional and technical workers). Between 1979 and 1989, authors' earnings grew faster than those of the reference groups.

These earnings increases may initially seem dramatic. However, most have not even kept pace with rising prices. After deflating earnings to allow for changes in the Consumer Price Index over this period, it is apparent that in constant 1969 dollars, authors' earnings fell from \$8,743 in 1969 to \$5,524 in 1979, and then rose to \$6,906 in 1989. Thus in constant 1969 dollars authors' earnings fell by \$1,567 over the 1969-1989 period. By comparison, all artists combined lost \$684, editors and reporters lost \$265, and other professional and technical workers gained \$527 in real earnings during this time.

Earnings data for authors in the experienced civilian labor force tell essentially the same story, ranking the same relative to those in the other occupations: first in 1969, last in 1979, and lower than all but artists in 1989.

The earnings of full-time year-round authors in 1989 were \$35,896, or about \$12,500 more than the earnings of all Census authors, ranking first among the reference occupations in 1969 and last in 1979. In 1989, authors earned more than all artists, and than editors and reporters and technical writers. In real 1970 dollars, earnings of full-time authors fell by \$1,433, artists' earnings fell by \$1,604, editors and reporters' earnings fell by \$1,121, and those of other professional and technical workers fell by \$525.

The hourly wages reported in Tables 13 through 16 are constructed by dividing total earnings by hours worked. A comparison of these wages across the occupational categories for all Census members shows that authors had the highest hourly wage in all three Census years. In 1989, the author average hourly wage was roughly \$10 more than that of other professional workers. This is mainly because authors spent considerably fewer hours working than did the other professionals. In addition, a number of authors worked relatively few hours per year, but were very well compensated for their work. In two of three Census years, the wages of all Census authors were higher than the wages of experienced civilian labor force authors. Also, in general the wages of all Census or experienced labor force authors were higher than those of full-time year-round authors.

### Variability in Authors' Earnings

In every Census year, authors had a higher percentage of persons with zero (or negative) earnings than people in other comparable occupations. On the other end of the spectrum, Census evidence from 1970-90 shows that a higher percentage of authors had earnings at the maximum level (the level at which the Census assigns persons the same value regardless of actual income or earnings). Also, a higher percentage of authors had asset income (and income from all sources) at the maximum than any other occupational group.

An examination of earnings variability data for authors and reference groups in the experienced civilian labor force shows the same relative outcomes. Naturally, fewer workers are found with zero earnings and more are found at the earnings maximum in each year. A higher percentage of authors again appears at both the low and high ends of the earnings spectrum compared to the reference groups.

With full-time, year-round workers, the percentages of persons with zero earnings shrink considerably, while high percentages of persons have earnings at the maximum. There are minimal changes in the rankings by occupational group.

Another statistic that highlights the concentration of persons at the low end of the income spectrum is the percentage of members in an occupation with household or individual incomes below the poverty line.<sup>1</sup> The poverty status of all Census authors and members of occupational reference groups is found in Tables 13 and 14. Income counted toward poverty status is from all sources, including other family members, and thus includes more than earnings. This statistic also measures the concentration of poverty in different groups.

Poverty rates of all Census authors, and of artists in general, are higher than those

of editors and reporters, technical writers and all other professional and technical workers combined. Poverty rates fall for experienced labor force workers, and fall further for full-time, year-round workers. What does not change is the relative ranking of occupations within each category. Authors and all artists have the highest incidence of poverty, regardless of the labor force definition employed. This finding is particularly notable given that authors had the highest household incomes of all the occupational groups.

Why are the earnings of authors subject to such variability? As mentioned earlier, authors, among other artists, work fewer hours in a year and experience greater variability in those hours worked. When one considers the career of authors and of many other artists, one sees persons who move among projects or employers. Compensation may differ greatly from move to move. A best-selling book may be followed by one which does not sell. Rarely is there a long-term contractual relationship with a steady employer with compensation rising gradually every year, as there is in many other occupations. Alternative explanations exist, as put forth in the introduction to this report. Artists, including authors, are often risk-takers and gamble on the chance of becoming famous and wealthy through their occupation. Then also, "psychic income" may figure in, where persons will accept lower compensation because of the satisfaction their occupation provides in itself. Reality may lie in a mixture of these explanations.

### Other Sources of Income

Total personal income—the sum of all income sources, including earnings—shows an improved status for authors when ranked against reference groups. In 1969, authors' personal income ranked first, as did authors' earnings. In 1979 and 1989, authors' personal income ranked third. The main reason for their improved status in the personal income rankings is the greater amounts of asset income authors receive, including royalties and income from property. Royalties are hypothesized to be the main difference in boosting authors' personal income; their asset income is from two to four times larger than the reference groups. Nevertheless, asset income averages only about one-fifth of total earnings for authors.

The total personal incomes of authors in the experienced civilian labor force rank the same in each year relative to the reference groups. Among full-time, year-round workers, authors' relative ranking in personal incomes is similar to those noted above, except that their personal incomes placed them first in 1989 as well as in 1969.

The personal incomes of authors and most of the reference groups failed to keep pace with inflation from 1969 to 1989. All Census authors, for example, suffered a loss of \$924 in real total personal income over this period. Authors in the experienced civilian labor force and full-time year-round authors also lost purchasing power over this period, by roughly the same amount.

The financial status of authors shows improvement when one moves from earnings to total personal income to total household income. Tables 13 and 14 show that authors rank first in total household income each Census year.

The primary contributor to household incomes other than the professionals described here clearly is the spouse or partner, when one is present. Why do authors have spouses who contribute more to household income than do members of other professions? One possibility is that authors, with their higher educational levels, might attract better educated spouses with higher earnings.

Authors in the experienced civilian labor force continue to rank first in total household income. The picture changes only slightly when full-time year-round authors are examined. Their household income places them first in 1969 and 1989, and second in 1979.

Regarding the effects of inflation, household income increases experienced by all occupational groups surveyed kept them ahead of inflation. All Census authors saw real household incomes rise by \$2,370 over the 1969-89 period, with reference groups seeing comparable gains. This general conclusion held true for experienced civilian force and full-time year-round counterparts in each occupational group. The basic reason household incomes kept ahead of inflation is the increasing labor force participation of women over the same period, so more family members were in the labor force.

### Earnings and Income by Gender, Race and Ethnicity

Tables 15 and 16 summarize information about authors' earnings and income by gender and race. Men dominated all personal earnings, income and wage categories in all three Census years. Women's annual earnings as a percentage of men's increased from 42.8 percent in 1969 to 47.1 percent in 1979 to 52.5 percent in 1989. Women's calculated hourly wage, measured as a percentage of men's, increased from 58.2 percent in 1969 to 82.0 percent in 1979, but fell dramatically to 40.4 percent in 1989. The wage disparity in 1989 is especially noteworthy. The high hourly wage earners referred to above are mostly men, whose mean wage in 1989 of \$40 is \$24 higher than the women's. However the men's median wage of \$12 is less than \$4 higher than the women's median.

In absolute dollar terms, differences in total personal incomes between men and women authors are larger than differences in earnings. In 1979 and 1989 men earned more asset income. However, women authors had greater household income—less than \$1,000 more than men—in all three Census years. While the household income of men authors is about one-third greater than their personal income, the household income of women authors is about two-thirds greater. Authors in general marry well, but women authors particularly find successful spouses.

Less overall disparity exists among earnings of members of different races and ethnic backgrounds. In general, white earnings are higher than those of blacks and Hispanics, but percentage earnings differentials are narrower than those between the sexes, and show no consistent trends. Black authors' earnings were between 80 and 90 percent of white authors' earnings, with the highest ratio in 1969. Hispanic authors' earnings were between 64 and 115 percent of white authors' earnings, with the highest ratio in 1979. Hourly wages showed similar small gaps in 1969 and 1979.

SOURCE: Authors' tabulations from the 1990 Census PUMS.

In 1989, however, the gap widened dramatically. Typically, larger disparities existed between the personal and household incomes of whites versus blacks and Hispanics, than between men and women authors.

The calculated mean wages of men authors and white authors more than doubled between 1979 and 1989, and significantly outpaced the growth in women and all minority wages. There was no comparable explosion in median wages for men and whites. Thus the growth in mean wages was driven by the success of a limited number of white men in securing very high hourly compensation for their output. In a similar vein, there was no explosion in the earnings of whites and men in 1989. The high mean wages reflect high hourly compensation, not high total compensation.

As discussed above, poverty levels are based on household incomes, and not just earnings. In 1979 and 1989, the poverty rates of men authors were higher than those of women. Similarly, in the same two Census years, the poverty rates of white authors was lower than those of black and Hispanic authors, by wide margins. In 1969, women authors had a higher incidence of poverty than men authors, despite having higher household incomes. Also, in 1969 white authors had a higher incidence of poverty than black and Hispanic authors, despite having higher household incomes. The unusual distribution of poverty incidence among ethnic groups in 1969 may partly be attributable to small samples of black and Hispanic authors in that Census.

### **Why Authors' Earnings Differ from Those of Other Artists**

There is little evidence that being an author per se increases one's earnings above those of other artists. A better explanation of authors' earnings lies in the importance of the human capital variables. Recall that authors were consistently older and better educated, and were more likely to be white, married and the heads of households. All of these traits are positively correlated with earnings. Although some traits of authors (such as more likely to be a woman and to be self-employed) predict lower earnings, on balance, a human capital interpretation of differences in artists' endowments of human capital would predict higher earnings for authors than for most other artist groups.

One might also expect authors to have the strongest verbal and writing skills of any artist occupation. Though not measured by the Census, these traits are correlated with job success as well. There is considerable evidence that the majority of the earnings of authors is not from writing. Thus it may be true that authors' verbal abilities enhanced their earnings in other occupations more than any general human capital skills possessed by other artists.

### **Authors in the U. S. and Elsewhere**

This section continues to explore the economic condition of writers over the period 1970 to 1990. It differs from the previous chapter because it does not use data from the U.S. decennial censuses. The Census, while complete in such important

dimensions as coverage of the population, is weak in describing the complexities of the labor market experiences and income generating opportunities utilized by writers and other artists.

Multiple job holding among writers will first be examined, using the Census' close cousin, the Current Population Survey. Then information will be provided on a number of issues relevant to the writers' socioeconomic condition, utilizing data from a variety of surveys and studies. Last will come a brief comparison of the U.S. writers' socioeconomic condition to writers in several other countries.

### Current Population Survey

Multiple job holding is a characteristic of writers' and artists' labor market behavior that somewhat sets them apart from most other workers. Generally the term, multiple job holding, suggests that more than one job is held concurrently, but the data does not always confirm this.

The Current Population Survey (CPS) interviews approximately 60,000 households annually.<sup>10</sup> Since artists are such a small proportion of the overall labor force, just over one percent, and with writers being only six percent of all artists, the accuracy of the CPS estimates as they relate to artists and writers is of concern. What could appear as considerable change in the behavior of writers nationwide might result from the change in the actions of a single writer in the sample.<sup>11</sup> However, the CPS does provide an important supplement to the census information.

Overall the multiple job holding rate in the U.S., calculated from the CPS, has shown a general upward trend, though it fluctuates with changes in economic conditions. In 1989 it was 6.2 percent.<sup>12</sup> The CPS indicates that multiple job holding is more common among artists and writers than other comparably trained workers. Eliminating those artists whose employment behavior is more like that of other professional workers than it is like an artist's (architects, designers and photographers), then the multiple job holding rate for artists was 13.7 in 1991. In both 1989 and 1991 the rates for writers were approximately 20 percent, the highest rates among the artist occupations, except for that of those artists whose primary job was teaching art at the post-secondary level. (Table 17)

Table 18 shows secondary occupations for individuals whose primary occupation was that of author. According to the CPS, the majority of these secondary jobs were in other professional occupations. In both 1989 and 1991 teaching something other than writing at a college or university was the most common second job for writers. Table 19 shows primary occupations for those whose secondary job was that of author. Not surprisingly, these primary jobs were in professional occupations, with a significant proportion of them being managerial.

Several characteristics of writers seem to be associated with multiple job holding. In 1985 and 1989, writers with second jobs were more likely to be male than writers who held only one job. The opposite was true in 1991. Writers who held second jobs averaged 10 years younger than those who did not, suggesting that multiple job holding is more common among the new entrants into the writing occupation.

It is interesting to note that about one-third of the artistic occupations to be held as a second job was that of musician. Writers, on the other hand, accounted for only about seven percent of the secondary artistic employment in 1985 and 1991, and almost thirteen percent in 1989.

### Non-Census Surveys

Sources of information about authors other than national censuses are special studies which fall into three categories. One category includes studies based on general surveys of artists where a broad range of artistic occupations is targeted. A second category includes studies based on specialized surveys of a single artistic occupation such as authors. A third category is information provided by artists to a professional organization or union and retrieved from an organization's administrative records.

First of the two general artist surveys to be examined is the Alper-Wassall Survey (AW) of artists in New England.<sup>14</sup> The second will be the Joan Jeffri survey undertaken by Columbia University's Research Center for Arts and Culture<sup>15</sup> of ten U.S. locations, incorporating eight cities and two non-urban areas (RCAC). Both studies were undertaken in the 1980s.

Next to be discussed is a survey explicitly designed for authors, the Kingston-Cole study,<sup>16</sup> done by Columbia University's Center for the Social Sciences for the Authors Guild Foundation. This study draws heavily on the definition of an author

established by the Guild. This means that those included in the study were book authors whose work had been published. This study, while undertaken in the early 1980s, refers to the situation of writers in the late 1970s.

Last to be examined is information from three Writers Guild of America, west (WGA) studies of writers in Hollywood.<sup>16</sup> Utilizing administrative records, the WGA reports provide a detailed, but limited, description of writers in the motion picture, television and radio industries. They are necessarily limited to the information the WGA maintains on its members and to what the members are required to report to the WGA. One of its strengths is that with readily available administrative data, several reports covering 1982 through 1991 could be prepared, providing a longitudinal study not available from any other source.

### Alper-Wassall Survey

The Alper-Wassall New England Survey studied artists in the six New England states in 1981 and 1982. Authors comprised 12.1 percent of the sample. In comparison, authors comprised 4 percent of artists in the 1980 census. Based on a system of self-identification, 62.4 percent of the authors were "writers," 32.0 percent were "poets" and 5.5 percent were "playwrights" and other creative writers.

Table 20 highlights the demographic characteristics of the New England authors and compares them with other regional artists. Authors average about 43.5 years in

age, contrasted to 40 years average age for other artists. Authors are better educated, with three times more holding doctorates than all artists. Writers were not likely to attend specialized arts schools, and relatively unlikely even to major in their field through their undergraduate education.

Authors do not dramatically differ from other New England artists regarding marital status and racial distribution, but slightly more than half the authors are female, unlike performing artists, but more like visual artists.

Alper-Wassall identified three separate labor markets that authors, and all artists, were likely to participate in. One was the market for their art work. A second was working in a job related to the arts, including teaching their art and arts administration. The third was working in a job completely unrelated to the production of their art work—the proverbial taxi driver or waiter, for example.

Every author in the study spent some time during the year writing, but only about one in five were full-time writers. (see Table 21). Authors averaged about 33 weeks of the year working as authors, about the same time spent by the other artists in the production of their art. Like their artistic peers, most authors with arts related jobs (almost 75 percent) were involved in teaching their art at some level. Alper-Wassall found that one in five authors were unemployed at some time during the year, averaging 13 weeks out of work.

Almost 45 percent of the authors in this survey held a job unrelated to their writing with about one-fourth of these jobs in non-teaching professional

| Weeks Worked in Non-Arts Related Job   | 15.3    | 11.7       | 11.5           | 12.0        |
| Source: Authors' tabulations and calculations from Alper-Wassall's study of New England artists. |         |            |                |             |

occupations. Approximately 15 percent held teaching jobs not related to their writing and another 10 percent were employed in food service type jobs. Often working at two or more jobs at a time, authors spent approximately the same number of weeks working as writers as in work related to writing and unrelated work combined. They appeared to earn more per hour from their non-writing work.

Table 22 details the authors' employment experiences as reflected in their earnings and total income. Authors' total income, which included earnings from their various jobs and such non-labor income as rent, interest and dividends, was \$17,126 in 1981 dollars, about 10 percent higher than that of all New England artists. It is not clear from this study where authors would have included any royalty income they might have received.

Source: Authors' tabulations and calculations from Alper-Wassall's study of New England artists.

Authors, like most artists, incur significant costs in order to produce their writing. New England authors incurred costs of about \$2,000 in 1981. The impact on their earnings from writing was that authors' earnings net of costs were slightly more than half their gross earnings from writing.

The hourly wage rate for the time authors spent writing was estimated to be \$2.62, less than 80 percent of the federally legislated minimum wage in 1981 which was \$3.35. The authors' estimated wage rate from the 1980 Census was almost \$13, but it reflected earnings from all the jobs held and not simply from working as a

writer. Weekly earnings from all jobs worked, which clearly do not correct for differences in the hours worked per week, showed authors were above average compared to other artists.

However the author works—as an employee, self-employed or free-lance—he or she must learn about employment and writing opportunities, or must know how to market his/her work. More than half the authors studied by Alper-Wassall found writing jobs through friends and relatives. Networking through former business associates was a method utilized by almost half the authors in searching for a job. Of course, multiple methods are used in job searches at various times. For authors in New England these included advertisements, booking agents, private employment agencies, public employment offices, student placement offices, and “other.”

The marketing methods most commonly used by New England authors were agents, consignment in showroom or shop, shows and fairs, advertisements, own showroom or shop and “other.”

Table 23 highlights some demographic differences between male and female authors and their artistic colleagues in New England, while Table 24 examines the labor market characteristics of these authors and their fellow artists. These findings are summarized briefly here:

| Source: Authors' tabulations and calculations from Alper-Wassall's study of New England artists.                |         |        |            |        |                |        |             |        |

Male and female writers were found to be essentially the same age. Female writers had less formal education than males, with male writers more than twice as likely to have a doctoral degree. The proportion of male and female authors married or living with someone who shared income and expenses was much the same as was the

proportion of each gender in minority groups. In general women writers did not do as well in the labor market and were more likely to be unemployed during the year. Female writers were half as likely to be full-time writers as their male colleagues, and were found to work less time per year than male writers.

Differences in earnings for authors in this study are available, but not detailed here. Generally, women authors earned about 18 percent of what male writers earned from writing on an annual basis, but fared better with regard to other earnings. Overall, though, the female writers' annual earnings from all sources were half their male colleagues, while their total weekly earnings were 63 percent of what male writers earned. Female writers' household income was only slight lower, 3 percent, than that of male writers. Most authors who held writing-related jobs taught at some level, with more men teaching at the college level. Male writers also were seven times more likely to work in managerial and executive jobs. Female writers were about seven times more likely to hold clerical jobs, while male writers were about five times more likely to hold operative and laborer jobs, a pattern consistent with that observed in the general population.

### Columbia University's Research Center Arts and Culture Survey

Another general survey of artists undertaken by Columbia University's Research Center for Arts and Culture (RCAC) focussed on examining the work-related

human and social service needs of artists. It was a mail survey in 1989 of artists, not simply authors. It covered Boston, Chicago, Dallas, Los Angeles, Minneapolis/St. Paul, New York City, Philadelphia and San Francisco, plus Western Massachusetts and Cape Cod.

The RCAC study provides some valuable insights into the economic condition of authors, and with its similar findings to other studies it becomes part of a useful body of studies that confirms the uniqueness of artists in general, and authors in particular.

Authors in this study were very highly educated, especially those who stated their major area of concentration as "writing/literature." More than one-third had bachelor's degrees and more than one-half had graduate degrees. Over 63 percent had formal degrees in arts. RCAC authors are somewhat younger, more likely to be women, and more racially and ethnically diverse than both the Alper-Wassall and Census authors. They started their training at 16.4 years, which is relatively old compared to other artists. Most interesting is that the vast majority, 80 percent, indicated that they were, at least in part, "self-taught" writers. More than 40 percent of RCAC authors prepared for their writing careers through the use of private teachers and/or mentors.<sup>18</sup>

Table 25 details the labor market characteristics of RCAC authors. Their unemployment rate was almost double the national rate. Almost 90 percent of the writers needed to work at some non-writing job to support their art, and nearly half of them held multiple jobs at the time of the survey. A significant proportion indicated they worked more than a standard 40-hour week.

The authors' income sources were varied, including working as a writer or other artistic endeavor. Only a minority had income from grants and/or awards, royalties, and unemployment insurance. (Table 26) Barely half the authors earned more than \$500 (1988 dollars) from writing, writing-related or arts-related activity. An estimate of the average authors' earnings is over \$4,600, enough to cover the expenses associated with producing their artistic work for just 43 percent of the writers.

Earnings from work unrelated to writing played an important role in determining the authors' economic well-being. Almost half the RCAC writers had total income greater than \$20,000, with the average income estimated at almost \$21,700. This suggests that, on average, almost \$17,000 of their income came from work not related to their writing or other activity and from non-labor income sources.

### Special Artist Surveys

The number of studies based on surveys of a single artistic occupation are relatively few, which makes the Columbia Survey of American Authors (CSAA) sponsored by the Authors Guild Foundation so unique.<sup>19</sup> In addition to describing authors' experiences and economic condition, it obtained information that is idiosyncratic to the authors. It dealt with writing genre, separating information for writers of children's book, adult fiction and adult nonfiction, for example. It also made distinctions between different types of royalties.

Source: Authors' tabulations and calculations from Jeffri's study of artists.

The CSAA surveyed almost five thousand writers in 1980. Approximately 60 percent of those sampled were from the Authors Guild's membership list. The remaining 40 percent were from a list of authors who had been invited to join the Guild, but had not done so. Therefore, this survey included only writers as defined by the Authors Guild's membership criteria: Writers with at least one book published in the last seven years, three works of fiction or non-fiction published by a magazine in the last 18 months, or a writer whose professional reputation entitles him/her to membership according to the Membership Committee. The study excluded academic writers, screen writers and new entrants to the writing market.

Findings from the Columbia survey are generally consistent with those from the other two studies discussed. The survey identified 40 percent of authors as being women. CSAA authors were well educated, predominantly white (97 percent) and about two-thirds were married.

Fully 70 percent of the authors had labor earnings from work other than their writing. Almost half the authors (46 percent) held regular salaried positions other than as a writer, and 40 percent of those without regular non-writing positions worked irregularly at things related to their writing such as editing, translating and lecturing. Approximately 40 percent held non-teaching professional jobs, and an equal proportion held teaching jobs, mostly at colleges and universities (90 percent).

If the CSAA authors had to live only on earnings from writing, the majority would be in poverty. It was the non-writing activity and the income of the writers' spouse/spouse equivalent that provided total family income comparable to, if not better than, most professional workers.

The typical (median) free-lance writer earned \$4,775 in 1979 dollars from writing. About 10 percent of the free-lancers actually earned no income from writing-related activities and one-fourth earned less than \$1,000. The top 10 percent of writers earned \$45,000 or more, and the top 5 percent earned more than \$80,000 from writing. The hourly wage for writing-related work, after controlling for the amount of time spent, was \$4.90 per hour.

In general, the CSAA authors' writing-related income was somewhat less than half their personal income. Family income for the typical CSAA author was \$38,000, reflecting considerable work effort on the part of each author's spouse. The contribution of the typical writer's husband to the household income was about \$26,000, and that of the typical writer's wife about \$4,000.

One factor correlated with writing-related income was the author's writing genre. Poets earned the least from books, with approximately 60 percent earning less than \$2,500, and almost 75 percent earning less than \$5,000. Authors of "academically oriented nonfiction" fared only slightly better with almost 70 percent having earned less than \$5,000. Writers of genre fiction (westerns, thrillers, science fiction, etc.) did better. Almost one-fourth of them earned in excess of \$50,000 from their writing, while about the same proportion earned less than \$5,000. By comparison, only 15 percent of writers of general adult fiction and 7 percent of children's books writers earned more than \$50,000.

The author's gender made a difference. Median earnings for female authors was 77 percent of those for male writers (\$4,000 vs. \$5,200). This difference did not exist

at the extremes of the earnings distribution, as approximately the same proportion of men and women earned less than \$2,500 and more than \$50,000 from writing. For "committed full-time" writers, writing genre helped explain the gender wage differential. Women were almost three times as likely as men to write children's books, which usually don't generate as much income as other books.

Because the CSAA study collected information on more than one year's income, a limited analysis could be made of the stability in authors' writing income. At the extremes of the income distribution a great deal of stability existed. More than 80 percent of those earning less than \$2,500 in 1978 from their writing did so in 1979. Half those who did improve earned between \$2,500 and \$4,999, only a slight improvement. At the other extreme, almost 90 percent of the writers who earned \$100,000 or more in 1978 did so in 1979, and of those who did change, half were still earning between \$50,000 and \$99,000. Between these two extremes, fewer than half the writers with 1978 writing incomes between \$2,500 and \$19,999 remained in the same income group in 1979. Approximately 60 percent of writers with incomes in the range of \$20,000 to \$99,999 were in the same income category in both 1978 and 1979.

### Administrative Records

Writers belong to a variety of professional organizations, including PEN and the Authors Guild, but very few of these organizations have any need to regularly collect information on the employment or earnings of its members. Very irregularly they may survey their members, as with the Authors Guild's study discussed above.

Writers' unions, however, do need to regularly obtain employment and earnings information from their members, many of whom are independent contractors, rather than more traditional employees. The only way their unions can ensure that they are being compensated according to the negotiated rates is for the members to report their employment activity. It is also important in establishing employers' contributions to the unions' health and welfare funds.

Two of the largest unions for writers are the Writers Guild of America and the Dramatists Guild. The Writers Guild of America (WGA) is the only true writers' union because it is recognized by the National Labor Relations Board. This is because it represents writers who are employees, rather than writers who are independent contractors or who lease their copyrighted material to others. The WGA organizes writers, bargains with the production companies, networks, etc., and administers agreements in the television, radio and movie industries. Two affiliated unions make up the WGA: the WGA, East and the WGA, west. The Mississippi River divides the membership.

The WGA, west, the larger of the two, has been very active since the mid-1980s in studying the employment experiences of its members, producing three reports which are derived from their administrative records.<sup>24</sup> The use of these records provides reliability that is not available from surveys of writers which rely on their memories or records. Also, there is no problem of response rate as with a survey.

On the other hand, the information in the union's administrative records probably does not provide a complete picture of the labor market experiences of its members. This is especially true for those writers who are not currently employed or who were employed part-time during the year. Other sources of labor earnings, whether from some other form of writing or not, are not included in the WGA records. Nor is any income from non-labor sources, such as unemployment benefits, welfare, rent, or other family members.

New entrants into the occupation are not likely to be included. One reason is the initiation fee, \$1,000 for WGA, East, for example. Newly employed writers who have not worked enough to be admitted to the union clearly are not included either.

The union's records do not include much background information on the writers' education, training, socioeconomic background, and other elements of their lives that are relevant to a complete understanding of their economic condition.

Even with these shortcomings, the three reports provide an interesting picture of the earnings and employment of writers in the television, film and radio industries—a picture consistent with what has already been discussed.

Like the three reports written by Bielby and Bielby, the primary focus here will be on the employment and earnings experiences of women, minorities and "older" writers. It is, though, important to look first at the broader changes affecting WGA, west members.

Employment of writers in the television, film and radio industries grew by more than 30 percent from 1982 to 1991 to almost 3,700 writers. The supply of writers outpaced the growth in jobs over this period. In 1985, 54 percent of the WGA, west members were employed in jobs covered by the unions' Minimum Basic Agreements (MBA) for at least one quarter during the year. In 1991, this percentage had decreased to 48 percent.

Earnings of WGA, west writers grew considerably from 1982 to 1991. Median earnings (nominal) for the employed writers grew almost 117 percent, from \$26,100 to \$56,619. Earnings growth was not equally shared by all writers. Those in the top 5 percent of the earnings distribution saw their earnings grow by 96 percent over the period, picking up momentum from 1987 to 1991. Bielby and Bielby concluded that the gap between the highest paid and lowest paid writers grew in the late 1980s.

Overall WGA membership grew by 40 percent from 1986 to 1991. Female membership grew by 60 percent and minority membership almost doubled. However, the occupation is still dominated by white males, who represented 75 percent of the employed writers in 1991. The proportion of females was 22 percent, and minorities, almost 3.5 percent. Older writers, defined by Bielby and Bielby as more than 40 years old, had a 48 percent share of employment in 1991.

The differences between WGA, west's earnings by gender are similar to the Census and other studies discussed. Throughout the ten-year period the median earnings of employed female writers were considerably less than male earnings. By the end of the decade women writers' median earnings were \$45,995, or 75 percent of male writers. These figures include only earnings from writing jobs covered by the MBA. Also, the studies do not provide information on the number of hours worked

which would enable the estimation of a wage rate.

With respect to minority writers' relative earnings, the decade from 1982 to 1991 was a period of considerable gain. In 1982 the median earnings of minority writers was \$11,780, or 40 percent of those for non-minority writers. By 1991 the median earnings for minority writers were \$48,061, or 80 percent of the earnings of non-minority writers.

WGA, west data suggests that significant earnings differences exist among members depending on the genre in which they are working and by whom they are employed. In 1987 the median earnings for television writers were 22 percent higher than those of the median film writer, but this gap closed to 3 percent by 1991.<sup>21</sup>

Throughout the entire period of the three WGA studies, the writers who worked for the major film production companies earned more than the writers in any other sector of the film or television industries.<sup>22</sup> Relative to the writers who worked for independent film producers (e.g., Orion and Gaunt Films Ltd.) those who worked for the major producers (MGM, Paramount, etc.) earned 72 percent more in 1982 and 115 percent more in 1991.

In television the pattern was essentially the same. Writers working for the major producers of television shows (e.g., Columbia and Fox) earned 62 percent more in 1982 and double in 1991 what the writers employed by independent production companies earned. Writers employed by the three television networks also earned considerably less than those who worked for the major production companies.

With regard to earnings, the relative difference between female and male writers varied within the genres. Women writers' relative earnings showed greater improvement among film writers than television writers. In 1987 the median earnings of female film writers was two-thirds that of white-male film writers. In 1991 the gap had narrowed to 86 percent of male earnings. In the television industry the 1987 differential ratio was 68 percent, but improved to 77 percent by 1991.

Within the film industry earnings of female writers fluctuated considerably relative to male writers, but from 1982 to 1991 showed improvement in major film production companies from 75 percent to 85 percent. Among the writers in the smaller film production companies, female earnings in 1982 were 80 percent of male earnings, and in 1991 were 78 percent of their male colleagues.

The television industry saw female writers working for the major networks make significant gains over the 10-year period. In 1982 female writers earned 57 percent of male writers' earnings, but by 1990 and 1991, female writers' earnings were on par with male writers' earnings. Women writers working for the major television production companies in 1982 earned 61 percent of what male writers earned, but by 1991 they were earning 90 percent of what their male colleagues earned.

Minor gains were also made in the numbers of women writers employed in television and film industries over the ten-year period. In the film industry female writers were 17 percent of the writers employed at the major studios in 1982 and 18 percent in 1991. At the independent studios female writers were about 14 percent of the writers in 1982 and 18 percent in 1991. In television production female writers for the networks moved from 24 percent of writers employed in 1982 to about 27

percent in 1991. One of the largest gains in female employment was among the major television production companies where women comprised almost 19 percent of writers employed in 1982 and 23 percent in 1991.

Identifying trends in earnings or employment for minority writers is made more difficult by the relatively small numbers having been employed at all. For example, in 1987 the 13 minority writers working at major film production companies earned 40 percent of their white male colleagues' earnings. One year later, minority writers—only five in number—apparently earned 135 percent more than their white male colleagues. Small absolute changes, but significant changes in relative terms, thus impact aggregate data even when utilizing medians.

Considerable employment gains have been made by minority writers in both the television and film industries. Over the ten-year period minority employment in the major television production companies increased from 2.3 percent of total employment to 4.4 percent. At the networks minority representation among the writers increased from 1.0 percent to 4.6 percent. Absolute numbers were small, with just 16 minority writers at the networks in 1991, up from three in 1982. Minority employment at the major film studios increased from 1.0 percent to 3.2 percent, while at the independent studios employment for minority writers went from 1.0 percent to 2.2 percent. The total number of minority writers working in the movie industry in 1991 was only 50, up from 11 in 1982.

Earnings of minority writers in the film and television industries relative to their white-male counterparts were volatile, but generally trended upward. In 1982 minority writers employed by the networks earned 55 percent of what the white-male writers earned. By 1991 they were earning almost 70 percent of what their white-male colleagues earned. At the major television producers median minority earnings moved from 57 percent of median white-male earnings in 1982 to 93 percent by 1991. In the film industry minority writers' median earnings at the major film studios went from 25 percent of the white-male median in 1984 to two-thirds in 1991. Gains for minority writers were greater among the independent film producers where in 1982 their median earnings were one-third of their white-male colleagues, but in 1991 were 18 percent larger.

### Writers in Other Countries

It is interesting to note, even briefly, that general patterns found for authors in the U.S. tend to hold for authors in other parts of the world. International comparisons of authors are made difficult because few other countries except Australia and Canada obtain detailed information on the earnings and labor market experiences of the population comparable to that collected in the U.S. However, bearing that in mind, it is possible to observe some commonalities.

The number of authors in other countries is also very small compared to the overall work force. In Australia and Canada, where census data are available, authors accounted for less than one-third of a percent. In the U.S. they were less than one-tenth of a percent. As in the U.S., the majority of writers in Canada, Finland and

Australia were men, about 55 percent of the total. In France the proportion of male writers is much larger, about 80 percent. In several countries, as in the U.S., the proportion of female writers has been growing.

Countries with data available on schooling showed authors to be very well educated. In Australia 44 percent of the authors had earned the highest degree reported in the census, compared to 8 percent for the total work force. In Canada in 1981, 42 percent had earned bachelor's degrees, while only 10 percent of the general work force had done so. This pattern was also found for authors in Finland and France.

In all the countries studied female authors' income was lower than that of their male colleagues. The differential some places was considerably less than in the U.S. where the median income for female writers was 52 percent of male writers' incomes. In Australia in 1986 female writers earned about 80 percent of what male writers earned. In Canada in 1980 female writers' income was about 65 percent of male writers' income. Even in Finland in 1984, where extensive public programs support all artists including writers, female writers had incomes that were 68 percent of male writers.

Several surveys of writers in Great Britain, France and Finland confirm that writers there are not very different from writers in the U.S. In these countries the majority of writers had held multiple jobs at some point in their careers. In England in the early 1980s, 67 percent of writers surveyed identified writing as a secondary occupation. Finnish writers, too, are likely to be multiple job holders and not likely to be able to earn a living from their writing alone.

## Conclusion

During the decades covered by this report, 1970 to 1990, there was a dramatic growth in the number of artists in the United States, with authors standing out as the fastest growing of the artistic occupations. According to the Census, the number of authors almost quadrupled, while the number of artists barely doubled. This period of growth saw considerable change in the composition of the occupation. At the end of the period women comprised half the authors when they were only one-third at the beginning. The proportion of non-white increased somewhat as did the education level, which was the highest among the artist occupations and on par with workers in other professions.

The authors' labor market experiences also underwent some significant changes. In 1990 they were more likely to be self employed than they were in 1970, following a similar trend in the labor force as a whole. They worked slightly more hours during the week when they were working, but worked fewer weeks during the year.

The economic condition of authors showed some signs of improvement and some signs of deterioration over the period. This is true relative to all other artists and relative to other professional workers. While the growth in authors' wage and salary earnings was considerable, it was not as large as it was for all artists and for all professional workers, perhaps reflecting the shift toward self employment. On the

other hand, authors' total personal income was still higher than for all artists at the end of the period as it was at the beginning, as was total household income. The largest gain made by authors was in their hourly wage rate. Its increase was greater than the increase for all the artists, professional workers and other writing occupations. As a result of some of these changes, the proportion of authors in poverty increased, but not as much as for all artists.

While these changes were occurring in the U.S., some of them were also occurring in other countries. Australia, Canada and Finland saw growth in the proportion of female authors. One common element that characterizes authors, and artists, throughout the world is the prevalence of multiple job holding. While this is not identifiable in the Census data, every survey of artists and authors, whether in the U.S. or elsewhere, finds this to be a common trait. In most countries the majority of writers work at more than one job during the year. For many this involves a job related to their writing, such as teaching, but for others it is the proverbial food service job. Another common trait is that female authors, on average, earn less than their male colleagues. There are many explanations for this pattern, including that women tend to spend less time working as writers, and that they write in genres that are not as well rewarded.

The authors occupation world-wide is undergoing considerable change. Future research targeted to the distinctiveness of writers will be needed to determine these patterns and the impact of the changing economic and technological environment within which they are working. Change is inevitable, but what direction it takes and how it impacts authors is yet to be determined.

## Notes

1. In practice the two definitions are virtually equivalent. There is often no difference between the two with respect to the occupations examined here.
2. The Hispanic question in the 1970 Census was worded differently than in 1980 and 1990, thus the information reported on Hispanics may not be comparable.
3. The Census has several questions about disability status. Tables 5 and 6 refer to those who report a disability that either limits or prevents work.
4. Unemployment rates for the years between Censuses can be calculated from the Current Population Survey. Sample sizes are much smaller, however, so they are not reliable for small occupational groups such as authors.
5. Because of this practice, total earnings reported in the tables may slightly exceed the sum of the wage and salary and self-employment earnings reported above it.
6. One can only speculate where other types of earnings authors may receive, from fellowships and readings, for example, would be classified.
7. For example, in 1980 total personal income was estimated as the sum of the amounts in each of the seven categories, yielding possible amounts up to \$525,000. The Census capped it at \$75,000.
8. Comparisons of median earnings among these groups tell a more dismal story.

Authors start with the highest median earnings in 1969, and then have the lowest in 1979 and 1989.

9. The poverty line is a federally established standard constructed by multiplying the cost of feeding a nutritionally balanced diet by three. The poverty line increases with increasing family size, and is adjusted annually for changes in the cost of living.
10. Beginning with January 1994, questions about multiple job-holding are now asked on a monthly basis in the CPS.
11. In the 1991 CPS only nine individuals indicated their primary occupation was author, and that they held a second job.
12. Stinson (1990).
13. For example see Wassall, Alper, and Davison (1983).
14. For example see Jeffri (1989).

## About the Authors

Neil O. Alper is an associate professor of economics at Northeastern University. His teaching and research interests are in the area of applied microeconomics. Previously, Professor Alper had a joint position in the Department of Economics and the Center for Business and Economics Research at the University of Tennessee in Knoxville. He has published a number of articles, books and reports, and presented professional papers on cultural economics, economics of crime and labor economics. He received his baccalaureate degree in economics from the State University of New York at Stony Brook, and his master's and doctoral degrees in economics from the University of Pittsburgh.

Gregory H. Wassall is an associate professor of economics at Northeastern University. He has authored a number of articles on the economics of the arts and culture in books and journals. In addition, he has co-authored *The Arts and the New England Economy* (1989) and *Artwork: The Work and Pay of Artists in New England* (1983). He has served as a consultant to both regional and state arts agencies, and to state and local governments on issues facing the arts, education and tax policy.

## II. Artists Who Work with Their Hands

### A Trend Report, 1970 to 1990

by Joan Jeffri and Robert Greenblatt

#### Overview

Artists are always a product of their own times. The years covered by this report have seen resources developing for individual artists that have changed the artists' relationship to their own growth, careers and support systems. Such resources have taken the form of grants, arts service organizations, commissions, and cooperative and commercial galleries, to name a few. The G.I. Bill after World War II, for example, became a turning point in the formal higher education of visual artists.

Since 1970, development of the nonprofit sector on a broad scale has expanded opportunities for visual artists, providing many more venues to show their work. *Pro bono* attorneys, like Volunteer Lawyers for the Arts, have helped inform visual artists about their rights, including copyright. These signs of progress, and many more, continue to affect the careers and living conditions of those who work with their hands.

This report examines trends in the visual arts occupations of painters, sculptors, craft artists and artist printmakers—all of whom currently occupy one category of the United States Census—from 1970 to 1990 in the areas of employment, earnings and geographic distribution. In addition to information from the U.S. Census and related research monographs, information will be targeted from artist population surveys conducted by the Research Center for Arts and Culture at Columbia University and surveys by other researchers, including one commissioned by the New England Foundation for the Arts and a longitudinal study conducted by psychologists from the University of Chicago.

As discussed in the general introduction to this overall report on artists, there are both limitations and advantages to Census data sets and artist survey data sets. However, taken together, these sources provide a broader profile of visual artists in the United States than has been possible before.

A basic limitation of all these surveys is their regard of arts occupations as comparable to other trades and professions. Sociologist Judith Adler discussed this: "A study of artists in a society in which occupational membership is (fortunately) not defined or restricted by a guild, an academy or a state system of licensing can neither comfortably ignore problems of occupational definition nor resolve them." Accepting, then, an imperfect definition of art occupations, there are various limitations and advantages of the data used as a basis of this analysis.

The focus here with non-census data will be the 1980s. Several surveys which cover different geographic locations during that decade serve to complement and

broaden census data. Also, by 1980, public funding at the federal and state levels had become increasingly important to visual artists. And the 1980s marked the "art boom," as journalists describe it, a time when prices for contemporary visual art reached an economic peak in the marketplace. Also, the visual arts provided a catalyst, through controversy over work by artists Robert Mapplethorpe and Andres Serrano, among many others, for a broad-based public discussion of the role, function and support of art.

### Data from the United States Census

- **Multi-Categories.** Those who have a particular interest in visual artists will acknowledge that the combination of artist types in one category not only groups together very different kinds of creators, but each group interacts very differently with the profit and nonprofit marketplaces. Their commonality lies in the fact that they all work with their hands. Lumping together artists whose work can appear in multiples with artists who work in singular objects distorts the information gathered on earnings (money made from a single object, a limited edition, or a series of multiples), hours worked (time required to produce one painting, one sculpture, one craft work or the original for what will become a series of prints, glass goblets, etc.) and even geographic distribution (access to equipment from suitable studio space to foundries and kilns).
- **Multi-Jobs.** Another limitation of Census data regards multi-jobs. It is well known that artists often hold two or more jobs simultaneously. Artists included in the Census are asked to describe their chief occupation during the previous week and are cited under a single occupation. While the "reference week" may limit the artist's Census occupation according to the job he spent the most hours earning money from (i.e., taxi driving), there is no provision for his artist occupation to be cited. Finally, the broadness of Census categories tends to hide certain subtleties. (What about multi-media artists, for example?) Agencies like the National Endowment for the Arts seem to have understood these differences for funding purposes, using discrete categories which represent a broad variety of artists.
- **Multi-Art Forms.** A problem not addressed by the Census or most other artist surveys is the fact that some artists work in more than one art form. In the process of being an artist, they pursue a number of art forms until they find the one that best suits their mode of expression. They may work for a period of time in one art form and find their work evolving into expression through a different art form. Or they combine art forms, sometimes being labeled as multi-media artists and sometimes as hyphenates: painter-craftsperson, dancer-photographer, etc. Taken together with the multi-job and multi-career situations mentioned above, it becomes clear that accurate "artist categories" can be extremely complex.

How artists are placed in Census categories is discussed in the general introduction to this report. A few major discrepancies regarding artists who work with their hands are pointed out here.

- Artists are classified in the Census under Managerial and Professional Specialty Occupations with a subset of Writers, Artists, Entertainers and Athletes. Under this are finer categories of architects, designers, etc.
- Through the decades, even within this category, at least one occupation has gone through a major revision according to the Census: before 1980 there was no category defining "craft artists," so it is not known where craftspeople were identified. Since 1980, the craft artist is part of the multi-category. However, within the finer Census categories (just as examples) there are no categories for Fiber Artist, Weaver, Goldsmith, Silversmith, Leatherworker, Papermaker or Bookbinder. Calligraphers appear in the 1990 Census category "Artists, Performers and Related Workers, Not Elsewhere Classified," but are not counted in the Census figures which report craft artists.
- Before 1970 many of the artists in the multi-category analyzed in this report were classified under Artists and Art Teachers. In 1970 the category became Painters and Sculptors. Starting in 1980 the category became Painters, Sculptors, Craft Artists and Artist Printmakers.
- Job titles under the Census category "Painters and Sculptors" included in artist occupations of the 1980 Census, cardpainters, music autographers and tattoo artists.
- In the *1980 Standard Occupational Classification Manual* under the larger classification "Fabricators, Assemblers and Hand Working Occupations," the following were listed: Hand Sewing Occupations (Embroiderers?), Hand Painting, Coating and Decorating Occupations and Miscellaneous Hand Working Occupations. There were also separate listings for Bookbinders and Cabinet Makers. Clearly, not everyone who fits into one of these categories would claim he is an artist or craftsman, but some would. The above examples illustrate difficulties of inclusion as well as exclusion in Census categories.

### Discrete Surveys

Three surveys conducted by the Research Center for Arts and Culture (RCAC) at Columbia University were used for this report and are summarized briefly here.

1. In 1986 The Artist's Work-Related, Human and Social Services Questionnaire surveyed 900 fellowship applicants to the New York Foundation for the Arts (NYFA) with a focus on visual artists categories in New York City. The RCAC administered the same questionnaire in three separate rounds of 300 artists each in March, June and September of 1986. In October a random sample of 50 artists was sent the questionnaire as a control group to ascertain if fellowship applicants responded differently before, during and after the fellowship application process, since this was a universe of artists applying for money. In fact, there was a significant decrease in the response rate from March 1986 before fellowships were announced to the subsequent two rounds after fellowships were announced. The 900 artists represented 14 artistic disciplines. The total response was 561 artists or 62 percent. Of these, 163 represent artists in the painting,

- sculpture and crafts categories in New York City. Information from the three separate rounds has been aggregated here.
2. In 1988 the RCAC conducted the Information on Artists Survey of 9,870 in 10 U.S. locations: Boston, Cape Cod, Chicago, Dallas, Los Angeles, Minneapolis/St. Paul, New York City, Philadelphia, San Francisco and western Massachusetts. Artists were located with the help of local, regional and national organizations, and the overall response rate was 4,146 or 42 percent. Although the sample was a random one, it is not certain that it was representative of the artist population, since one of the problems of artist definition is the universe from which the sample is drawn. Nevertheless, this information provides a parallel portrait to that portrayed by the U.S. Census. This report will focus on those artists who, when asked their major field of concentration, gave painting/drawing, sculpture or crafts as their first, second or third choice.
  3. The 1991 Artists Training and Career Project surveys focused on painters and craftspeople. In the craft survey 3,942 questionnaires were mailed to a random sample in 1990. The response rate was 33 percent, representing 1,301 craftspeople. In the painters survey, a random sample of 2,000 painters was mailed in 1991. The response was 960 painters or 48 percent with 2 percent arriving after the data entry period, so 920 painters or 46 percent was the number used for reporting.
  4. In addition, the survey conducted by Gregory Wassall and Neil Alper for the New England Foundation for the Arts between 1980 and 1982 will be used. For this report, Massachusetts is the focal point where 8,000 questionnaires were sent, with a response rate of 1,281 or 16 percent. Of this response, there are data for 291 painters, sculptors and craftspeople from greater metropolitan Boston. While this sample is small, it is interesting to compare these findings with those of the RCAC in its Information on Artists data on Boston, bearing in mind that the surveys are seven years apart and do not necessarily cover the same universe.
  5. One other study needs special mention since it is the only truly longitudinal study done of fine artists in this country. In 1963 two psychologists from the University of Chicago, Mihaly Csikszentmihalyi and Jacob W. Getzels, undertook a study which tested, interviewed and observed at work almost 300 junior and senior fine arts majors at the School of the Art Institute of Chicago. The purpose of their study of these fine arts majors "was to find out the extent to which various cognitive abilities...perceptual abilities, values and personality characteristics are involved in the making of art that is thought to be creative."<sup>2</sup> In 1980 these scholars were able to locate 250 of the original sample of 281, and administer the first truly longitudinal study of artists. The response was 208, or 74 percent. This second study focused on "the vicissitudes of creativity in art" and was also "a study of young people moving into adulthood."<sup>3</sup> It produced an unpublished report in 1984, *Talent and Achievement*, which provides important insights into the very areas tracked in this report: income, employment and geographical differences, as well as other areas.

## Challenges

- **Occupation vs. Career.** For some artists the ideas of "occupation" and "career" are not the way they choose to identify themselves. (Indeed, some painters interviewed for a RCAC project said that in their early painting days in the 1950s, "career" was not part of their professional vocabulary; they simply "were painters.") Since Census and most other surveys ask artists to "self-identify" either their occupation, career, or both, this creates difficulties for identifying the targeted population.
- **Professional vs. Amateur.** There is a question of who is a "professional artist," with disagreement in the art world itself as to what constitutes a professional artist. The question is also raised of who are "amateur artists," who are also producers of art. There is no formal Academy to accredit the artist, no equivalent to the attorney's bar exam to certify him. Even the university degrees of fine arts are not a universally accepted standard for being an artist.
- **Geographic Attitudes.** A "big city" bias exists for many, including many artists, in the art world. In most of the arts the centers of artist activity against which artists are always comparing themselves are New York and Los Angeles. For the visual artists addressed here, the primary locus seems to be New York. Montana painter Karen Kitchel discussed this bias: "The most widespread assumption in the U.S. art world is that if you're not in New York, you're nowhere...To simplify the tremendous amount of activity going on outside of New York City...is a transparent attempt to minimize any accurate sense of the creative depth, diversity or market in the United States...standards obsessed with regional hierarchy betray a lack of aesthetic focus and miss the point. They're out of date and fail to reflect this age of travel and instant information, as well as artists' diverse living and working arrangements."<sup>4</sup>

An application by Arts Midwest to the NEA in 1987 stated: "Visual artists choosing to live in the Midwest have fewer opportunities for encouragement, recognition and financial support...A study of artists published in March 1987 by the National Endowment for the Arts indicates that our region of the country has lost more artists than any other region over the five-year period researched...Arts Midwest believes that artists do not have to live in New York to succeed in their profession; although that city may boast an active artistic climate, it should not be the only place for artists to successfully create and market their works."<sup>5</sup>

Some interesting data supplement these opinions. In the study of fine arts students at the School of the Art Institute of Chicago previously mentioned, 25 percent of the former students stayed in Chicago, 17 percent lived in Chicago suburbs and another 18 percent lived in the Midwest. Only half the artists who lived in New York in 1981 were fully involved in art and "at least one-third had given up on the practice of art entirely. "In fact," say the study's authors, "moving to New York is clearly an either-or proposition: those living there are either committed or quit; very few remain only partly committed to art."<sup>6</sup>

In its 1988 study of 10,000 artists in ten U.S. locations called Information on Artists, RCAC found that of 4,146 responses, 61 percent of the painters and 58 percent of the craftspeople received art-related training in the city or region where they currently reside.

- **Art as a Core Activity.** Howard Becker describes some of society's attitudes toward the artist which complicate economic analyses: "Participants in the making of artworks, and members of society generally, regard some of the activities necessary to the production of a form of art as 'artistic,' requiring the special gifts or sensibility of an artist. They further regard those activities as the core activities of art, necessary to make the work art rather than (in the case of objects), an industrial product, a craft item or a natural object...The remaining activities seem to them a matter of craft, business acumen, or some ability less rare..." Becker goes on to describe how that core activity called art changes over time, painting once being regarded as skilled work and then elevated to more special status during the Renaissance, craft activities being redefined as art.
- **Artist Focus.** Some artists are considered "Creator oriented" with a focus on the process and creation of the work itself, and others are considered "consumer oriented." This is not an attempt to judge either the artists or their art, but to point out that the former state translates economically into limited audiences and low wages, according to Mary Jean Ryan in her dissertation, *In Quiet Desperation: Professional Strategies of the Aspiring Fine Artist* (UCLA, 1985).

Research in psychology has put the economic motivation of so-called "starving artists" in perspective by suggesting that some fine artists may operate according to intrinsic rather than extrinsic activity. Joanna Stohs defines intrinsic motivation: the fine artist "engages in art work for reasons such as satisfaction, intellectual growth, or emotional or psychological goals (self-fulfillment or gratification). There are no references to things outside the self (e.g. income or evaluations by others). The activity is sought because it increases competence or self-determination or provides inner rewards of personal challenges."<sup>8</sup>

Perhaps economic success is not of primary importance to the artists themselves, or at least to certain kinds of "fine artists." If this is true, measuring trends in income and jobs for these artists may be relevant compared to other professions, even other artists' professions, but may not necessarily represent the artists accurately.

- **Context: Education and Resources.** Enormous changes have occurred in opportunities for education and formal training for visual artists in the country and in public funding. BFA and MFA Programs in Fine Arts, targeted to all the artist specialties covered here, were well underway by the end of the 1960s. By the late 1980s, a Directory of the National Schools of Art and Design listed 164 programs. By the 1960s state arts agencies included every state and U.S. territory, the National Endowment for the Arts was created, and community and local arts agencies began strengthening their force. By the 1970s new programs targeting unthought-of constituencies were added to funding agencies (like the Expansion Arts Program at the NEA). By the 1980s agencies which funded individual artists

(like the New York Foundation for the Arts) joined together to form a seven-state consortium and received a challenge grant from the NEA. By the 1990s arguments of freedom of expression, censorship and the relationship between the government and artists centered around visual artists. Other developments in resources are mentioned at the beginning of this section.

### Other United States Data

Discrete surveys included in this report have a number of common characteristics. First, they all represent findings from artists in the 1980s. Second, they all relied on the cooperation of the arts institution community to provide lists of artists' names. While these lists aid in constructing a profile of people who are considered artists, they do not identify artists who do not join institutions, apply for funding or use service organizations. Finally, the studies included here seek to give some insight into the national as well as the local picture of artists.

For purposes of at least rough comparison with the U.S. Census, painters, sculptors and craftspeople are analyzed together as one category in three of the four studies examined by this report (artist printmakers were impossible to identify according to the definitional categories of the surveys.) Regarding the fourth survey, The Artists Training and Career Project, results were analyzed for one national study of painters and another of craftspeople.

### United States Census Data, 1970-1990

This research monograph looks at one Census occupation category of visual artists, which combines painters, sculptors, craft artists and artist printmakers, from 1970-1990. The accompanying tables provide the actual Census trends in employment, earnings, education and geographic trends by age and gender.

General trends in the experienced civilian labor force from 1970-1990 are discussed in the General Introduction and include overall growth in the labor force and trends by gender and age. This report will concentrate on visual artists.

Between 1970 and 1990 the total artist population more than doubled, from 720,000 to 1,671,000. While the male artist population almost doubled (a rise of 46 percent) from 499,000 in 1970 to 931,000 in 1990, the female artist population tripled from 221,000 in 1970 to 675,000 in 1990.

Female painters/craft artists by 1990 numbered 107,920, accounting for 56 percent of painters/craft artists. This compares to their percentages among all artists, up 7 percent from 1970 to 1980 and another 3 percent from 1980 to 1990. From 1970 to 1980 there was over 7 percent point rate of growth for women artists, although the growth rate of female workers slowed after 1980. For male painters/craft artists, rate of growth decreased from 64 percent in 1970 to 52 percent in 1980 and to 44 percent in 1990 (Table 1).

In 1970 painters/craft artists totaled 102,600; in 1980, they totaled 151,360, 14 percent of all artists; by 1990 they totaled 191,160, or 13 percent of all artists, the second largest of all artist occupations, representing .174 percent of the total labor force.

| <b>Notes:</b> Sums for men and women may not add to totals due to rounding.                      |         |           |           |

### Geographic Trends

According to Deirdre Gaquin<sup>9</sup> between 1980 and 1985, 41 percent of the population changed their place of residence. She warns that statistics for 1990 in this area are unreliable due to a change in urban/rural distinctions by the Census, so the following figures on artists and painters/craft artists are cited with caution.

In 1980, 86 percent of male artists and 85 percent of female artists were urban residents. By 1990, 78 percent of male artists and 72 percent of female artists were urban residents. Urban dwellers among male painters and craft artists went from 90 percent in 1970 to 86 percent in 1980 to 80 percent in 1990.

Urban dwellers among women painters and craft artists also declined, going from 86 percent in 1970 to 85 percent in 1980 to 76 percent in 1990, renewing discussion on whether artists need to work in the same geographic area where their work is sold.

Regarding distribution of artists by Census region, male artists by 1990 had highest proportions residing in the West; females had highest proportions residing in the South. Male artists had increases in the West, up to 30 percent and male painters and craft artists had up to 28 percent increases in the West, where their highest proportions were. Their most substantial decrease was in the Northwest.

Female painters and craft artists had highest proportions residing in the South, and their most substantial decrease was in the Northeast (Table 2).

Sources: All Artists and Painters, Sculptors Etc. for 1990 is Greenblatt. Data for 1970/1980 are Citro & Caquin. 1990 Professional Specialty Workers in from Caquin. All other data is from the U.S. Statistical Abstracts.

## Age

Trend data for age patterns is particularly difficult to assess with confidence for several reasons: the definitional changes of artists categories, the relatively small sample size for each occupation and the challenges presented in the first section of this report.

Between 1970 and 1990 baby boomers entered the labor force and male workers declined in labor force participation, possibly due to their choosing early retirement and the longer tenure of females in the job force.

Male artists were similar (but younger on average) in 1990 to all male workers with their median age dropping from 37-38 in 1970 to 34 in 1980 and rising to 37 in 1990. Male painters and crafts artists had higher median ages than the general labor force in 1990, but were closer to male professionals, moving from a median age of 39 in 1970 to 36 in 1980 and 40 in 1990.

For all male artists the largest age group was the 25-34 year olds with 31 percent. For male painters and craft artists, the 35-44 year old group was largest, with 29 percent (Table 3).

Female artists were similar (but younger on average) in 1990 to all female workers, with their median age dropping from 37-38 to 33 in 1980 and rising to 37 in 1990. For all female artists the largest age group was 25-34 year olds at 34 percent, and for female painters and craft artists the 35-44 year old group was largest with 31 percent (Table 3).

## Education

The post World War II availability of education in general, and for artists in particular, raised the educational profile of many Americans. For artists, although

their educational levels were higher than the general work force, they were below all professionals and showed smaller percentage point increase in proportions with college degrees.

In 1990, 40 percent of male artists had completed four or more years of college compared with 76 percent of male professionals. Forty percent of female artists had completed four or more years of college compared with 66 percent of female professionals. For male painters and craft artists by 1990, 37 percent had four or more years of college while 43 percent of female painters and craft artists had four or more years of college. Statistics on education suffer from a change in the wording of the Census questions and are to be viewed with caution. Also, the discrete studies on painters/craft artists provide a different profile.

### Employment and Earnings

Deirdre Gaquin summarized some striking trends characterizing patterns of employment and earnings after World War II. During those years men in the labor force trended away from self-employment and toward working for private employers and government. Women workers were also increasingly attracted to public sector employment and more workers, particularly among women, were employed year-round. Median earnings for men increased 75 percent and for women, 43 percent, from 1950 to 1970. After 1970, real earnings adjusted for inflation declined sharply, particularly among women, whose median earnings remained less than half those of men throughout this period.<sup>10</sup>

The trend in employment sectors for artists differs from that of the general labor force in the post WW II years, as artists moved toward self employment during this time. In 1970, 67 percent of male artists and 69 percent of female artists worked in private firms; 10 percent of male artists and 8 percent of female artists worked in government, and 23 percent of males and 21 percent of females were self-employed. In 1980 self-employment was on the rise, with 60 percent of male artists and 65 percent of female artists working for private firms, 7 percent of both male and female artists working for government, and 32 percent male and 28 percent female artists self-employed. By 1990 self-employment for artists had increased slightly with 33 percent of males and 31 percent of female artists self-employed, compared to 62 percent of male artists and 64 percent of female artists working for private firms and 5 percent of both males and females working for the government.

Painters and craft artists show still higher percentages of self employment, so that by 1990 nearly half of males and females were self employed. In 1970, 62 percent of male painters and craft artists and 58 percent of female painters/craft artists worked for private firms, 7 percent of males and 8 percent of females worked for government and 32 percent of males and 34 percent of females were self-employed. In 1980, 48 percent of both male and female painters/craft artists worked for private firms, 7 percent of both worked for government and 45 percent of males and 42 percent of females were self-employed. By 1990, 48 percent of male painters/craft artists and 45 percent of females worked for private firms, 5 percent of males and 4 percent of

females worked for the government and 47 percent of males and 49 percent of females were self-employed.

In terms of unemployment according to Census definitions, unemployment declined for both male and female painters and craft artists from 1980 to 1990 after a rise from 1970 to 1980.

For male artists, unemployment declined by almost 2 percent from 1970 to 1990, while female artists' unemployment declined by a full 2 percent. For male painters/craft artists, unemployment growth was less than 1 percent, but for females unemployment declined between 1970 and 1990 by less than 1 percent.

Problems arise in measuring year-round employment for artists, and even more so when it comes to painters and craft artists, since the nature of employment (1) often is not attached to a single employer; (2) is not always characterized as "employment"—the sale of a painting is not employment; (3) is not always measurable by the standards of full-time and part-time work the Census uses (many artists are literally always working) and (4) does not often translate into eligibility for unemployment benefits (because the artist's work time cannot be verified by an "employer.") The artist may be self-employed, but he also may earn most of his income at other work such as teaching, and declare his art income as "other."

That females earn less than males in all sectors is obvious throughout the 1970-1990 period. (Table 4). Male painters' and craft artists' median incomes fall below the medians for the total labor force and professionals. Female painters/craft artists' median earnings are either close to or above those of the total female work force.

The median income for male artists grew from \$8,768 to \$14,219 between 1970 and 1980 and to \$21,600 by 1990. For male painters and craft artists the median income grew from \$8,893 in 1970 to \$12,684 in 1980 and to \$18,187 in 1990. (Table 4)

For female artists the median income was \$3,637 in 1970, \$6,712 in 1980 and \$11,096 in 1990. For female painters and craft artists, the median was \$3,682 in 1970, \$6,612 in 1980 and \$22,041 in 1990 (more than triple the 1980 figure).

For those male artists who worked between 50 and 52 weeks per year, the median income almost tripled from \$9,550 in 1970 to \$27,961 in 1980 and went to \$31,124 in 1990. For male painters and craft artists the median income grew more slowly from \$9,672 in 1970 to \$15,112 in 1980 and to \$24,320 in 1990.

Female artists enjoyed a four-fold increase in median income from \$4,152 in 1970 to \$17,328 in 1980 and then a smaller increase to \$20,825 by 1990. For female painters and craft artists, the median went from \$5,347 in 1970 to \$9,344 in 1980 and to \$18,762 in 1990.

Full-year male painters and craft artists' median earnings exceeded that of their part-year colleagues, but full-year female painters and craft artists' median income did not.

In summary, by 1990 there was a larger proportion of women as painters, sculptors, craft artists and artist printmakers, with fewer living in urban areas. They had a higher median income than all artists and the general labor force, but were closer in median age to professionals. For both males and females, their level of

\*Please note change in ECLF age for females. (1) From Beresford Table 1. (2) From Statistical Abstracts, 1992, Table 656, page 414. (3) Beresford Tables 5 & 6 and Citro & Gaquin.

education, according to the Census, seemed to be holding steady or rising slightly, and many more were self-employed, with percentages much higher than other kinds of artists. The median income for male painters and craft artists grew more slowly than for the total male work force, male professionals and female painters and craft artists (whose median income more than tripled since 1980). Finally, using figures that should be scrutinized further, it appears that part-year female painters and craft artists earned more than their full-year counterparts.

## Discrete Surveys

The Research Center for Arts and Culture conducted the three studies that follow, searching for an understanding of what artists do which is closer to their own perception than the Census. In addition to asking which occupation provided the artist's major income and number of hours worked, the survey asked:

- the occupation that is primary to the respondent
- the occupation that is most important to the respondent
- the major area of concentration
- If the respondent considers himself/herself to be a professional artist.

In the three RCAC surveys, 93 percent of the respondents to *The Artist's Work-Related, Human and Social Services Questionnaire* consider themselves professional artists; in *Information on Artists*, 89 percent consider themselves professional artists and in the *Artists Training and Career Project*, 91 percent of the painters and 86 percent of the craftspeople consider themselves professional artists.

A fourth study, the *Artists and Jobs Questionnaire*, commissioned by the New England Foundation on the Arts and done by Wassall, Alper and McCabe, is based on more traditional Census-based definitions.

### The Artist's Work-Related, Human and Social Services Questionnaire (1986)

The major area of concentration in this study is listed as painting, sculpture and crafts, but since 86 percent of the 164 respondents claimed the occupation that is primary to them is "artist," and since there are relatively small numbers to begin with, these findings must be viewed with caution.

This was a pilot study for the Research Center for Arts and Culture. Two of its contributions were broadening the base of investigation to a larger geographic area and the realization that studies which isolated particular types of artists would allow for a much more specific investigation.

- **Age and Gender.** The mean age for these artists was 38 (standard deviation 9.969) and the median, 36. (The mean is used as well as the median age in this chapter because in most cases the difference of two or more years is significant.) Half were male and half female.

- **Education.** Eleven percent of these artists had some college; 23 percent had at least four years of college and 63 percent had some graduate education. By gender, 29.1 percent of males and 16.1 percent of females had four years of college; 55.6 percent of males and 69.5 percent of females had some graduate education.
- **Income.** Twenty-five percent of these artists earned \$500 or less from their art in 1985 while 12 percent earned over \$20,000 from their art. By gender, 28.6 percent males and 21.4 percent females earned \$0-500; 26.8 percent males and 24.9 percent females earned between \$501 and \$3,000; 18.8 percent males and 21.5 percent females earned between \$3,001 and \$7,000; 3.6 percent males and 10.7 percent females earned between \$7,001 and \$12,000; 9 percent males and 11.6 percent females earned between \$12,001 and \$20,000 and 12.5 percent males and 9.8 percent females earned over \$20,000.

### Information on Artists Survey (1988)

Data presented here are for all artists and for the category of painters, sculptors and craftspeople for age, education, income and art-related costs. These same breakdowns are applied to Boston and New York, two of 10 sites surveyed. Tables 5 through 8 show data for all artist respondents from the broad variety of art fields used for the study. The text below will focus on the subject of this report, artists who work with their hands.

- **Age.** The mean age for painters, sculptors and craftspeople is 38.6, the median, 37.
- **Education.** Table 5 displays the educational attainment of these artists. When

| TABLE 5<br>INFORMATION ON ARTISTS |                           |                         |                        |                          |                           |                    |

| Painters: New York                |                           | 2.50                    | 9.70                   | 38.40                    | 50.70                     |                    |
| Male                              | n/a                       | 2.50                    | 13.80                  | 30.00                    | 53.80                     | 80                 |
| Female                            | n/a                       | n/a                     | 5.60                   | 46.80                    | 47.60                     | 126                |

broken down by gender, of male painters, sculptors and craftspeople, 35.5 percent have college degrees and another 44.8 percent have graduate degrees. For females, 45.7 percent have college degrees and another 41.3 percent have graduate degrees.

- **Income.** Table 6 shows total income as an artist and total gross income in 1988. For male painters, sculptors and craftspeople, individual income as an artist shows 25.4 percent earning \$500 or less; 26.6 percent earning between \$501 and \$3,000; 14.3 percent between \$3,001 and \$7,000; 9.9 percent between \$7,001 and \$12,000; 7.9 percent between \$12,001 and \$20,000; 9.7 percent between \$20,001 and \$40,000 and 6.2 percent over \$40,000.

For female painters, sculptors and craftspeople, individual income as an artist shows 26.9 percent earning \$500 or less; 33.7 percent earning between \$501 and \$3,000; 15.8 percent between \$3,001 and \$7,000; 9.7 percent between \$7,001 and \$12,000; 6.9 percent between \$12,001 and \$20,000; 5.3 percent between \$20,001 and \$40,000 and 1.7 percent over \$40,000. (Totals may not equal 100 percent due to rounding.)

- **Total Gross Income.** For male painters, sculptors and craftspeople, total gross income is: 7.1 percent earning \$5,000 or less; 12.3 percent earning between \$5,001 and \$10,000; 32 percent between \$10,001 and \$20,000; 20.6 percent between \$20,001 and \$30,000; 15 percent between \$30,001 and \$40,000 and 13 percent over \$40,000, similar findings to those for all artists in this study.

For female painters, sculptors and craftspeople, total gross income in 1988 is: 13.8 percent earning \$5,000 or less; 21.2 percent earning between \$5,001 and \$10,000; 33.5 percent between \$10,001 and \$20,000; 17 percent between \$20,001 and \$30,000; 8.8 percent between \$30,001 and \$40,000 and 5.7 percent over \$40,000. (Totals may not equal 100 percent due to rounding.)

- **Artists' Costs.** Relevant to earnings are the costs for space to work and maintenance of one's craft. About two-thirds of the respondents answered questions on costs. In terms of monthly costs for space, over two-thirds of the artists, including painters/craftspeople, paid under \$500 per month for workspace in 1988. (See Table 7.)

Annual art-related expenses (excluding workspace) include art supplies and services, tools and equipment, capital improvements, training and maintaining their craft, publicity, marketing, travel and shipping. For painters, sculptors and craftspeople, 86.2 percent of males and 78.6 percent of females spent under \$500 on their annual art-related expenses in 1988. Another 10.3 percent of male painters, sculptors and craftspeople and 19.5 percent of females spent between \$501 and \$2,500. Thus in 1988 over 89 percent of these artists spent \$2,500 or less on their art-related expenses.

Comments and informal information indicate that, especially for visual artists in need of expensive equipment like kilns, often their "other" employment (i.e. teaching) fills this need. This information is reinforced by the *Artists and Jobs Questionnaire* done in New England in the early 1980s.

**TABLE 6**

| Painters et al.   |               | 79.05                | 19.25                 | 1.70                     | 0.00                 |                      |                      |       |
| Male  |               | 81.80                | 18.20                 | 0.00                     | 0.00                 |                      |                      |       |
| Female  |               | 76.30                | 20.30                 | 3.40                     | 0.00                 |                      |                      |       |

- **Professionalism.** Eighty-nine percent of all artists in this survey consider themselves to be professional artists. To gain a better understanding of how artists view professionalism, a three-way division was used which included both external and self-assessment criteria. The groups of these definitions were done after the data were collected to identify three main areas:

1. *The Marketplace Definition.*

The person makes his/her living as an artist.  
 The person receives some income from his/her work as an artist.  
 The person intends to make his/her living as an artist.

2. *The Education and Affiliation Definition.*

The person belongs to an artists' association (discussion group, artists' group, artists' co-op, etc.)  
 The person belongs to an artists' union or guild.  
 The person has been formally educated in the fine, creative, literary or performing arts.

3. *The Self and Peer Definition*

The person is recognized by his/her peers as an artist.  
 The person considers himself/herself to be an artist.  
 The person spends a substantial amount of time working at art.  
 The person has a special talent.  
 The person has an inner drive to make art.  
 The person receives some public recognition for his/her art.

The above criteria were used in two questions, one which asked respondents to identify their three most important choices in rank order in considering "someone to be a professional artist," and another, similarly ranked, in which these "reasons apply to you." The figures below show the overwhelming first choice in the Self-Definition category.

#### IOA: IMPORTANT CRITERIA FOR PROFESSIONAL ARTIST

(When considering someone else to be a professional)

|                      | <u>Painters</u> | <u>Craft Artists</u> | <u>All Respondents</u> |
|----------------------|-----------------|----------------------|------------------------|
| Market Definition    | 18%             | 26.1%                | 23.1%                  |
| Peer/Educ Definition | 10.3%           | 12.5%                | 12.5%                  |
| Self-Definition      | 71.7%           | 61.4%                | 64.4%                  |

#### IOA: IMPORTANT CRITERIA FOR PROFESSIONAL ARTIST-Self

|                      | <u>Painters</u> | <u>Craft Artists</u> | <u>All Respondents</u> |
|----------------------|-----------------|----------------------|------------------------|
| Market Definition    | 16.1%           | 36.7%                | 22.8%                  |
| Peer/Educ Definition | 7.2%            | 7.6%                 | 9.3%                   |
| Self-Definition      | 76.8%           | 55.7%                | 68.0%                  |

### Information on Artists: Boston and New York

Boston had an artist population of 20,839 in 1980 according to the Census. The '80s were a time for increased public funding through the Massachusetts Council for the Arts and Humanities and progress on many levels for artists. The number of artists of all kinds surveyed in Boston total 350; of those 157 were painters/sculptors/craftspeople, the focus of the data below.

- **Age.** The mean age for all Boston painters, sculptors and craftspeople is 36.4; the median age, 35.
- **Education.** For male Boston painters, sculptors and craftspeople, 36.8 percent have college degrees, 47.4 percent have graduate degrees; for females 52.8% have college degrees, 40.3 percent have graduate degrees (Table 5).
- **Income as Artists.** For male Boston painters, sculptors and craftspeople, individual earnings as an artist look like this for 39 respondents: 28.2 percent earning \$500 or less; 30.8 percent earning between \$501 and \$3,000; 17.9 percent earning between \$3,001 and \$7,000; 15.4 percent earning between \$7,001 and \$12,000; 2.6 percent earning between \$12,001 and \$20,000; 5.1 percent earning between \$20,001 and \$40,000 and no one earning over \$40,000 (Table 6).

For female Boston painters, sculptors and craftspeople, individual earnings look like this for 73 respondents: 26 percent \$500 or less; 42.5 percent earning between \$501 and \$3,000; 13.7 percent earning between \$3,001 and \$7,000; 6.8 percent earning between \$7,001 and \$12,000; 6.8 percent earning between \$12,001 and \$20,000; 4.1 percent earning between \$20,001 and \$40,000 and no one earning over \$40,000.<sup>11</sup>

- **Total Gross Income.** For 37 male Boston painters, sculptors and craftspeople, total gross income in 1988: 5.4 percent earned less than \$5,000; 8.1 percent earned between \$5,001 and \$10,000; 45.9 percent between \$10,001 and \$20,000; 21.6 percent between \$20,000 and \$30,000; 10.8 percent between \$30,000 and \$40,000 and 8.1 percent over \$40,000 (Table 6).

For 72 female Boston painters, sculptors and craftspeople, total gross income in 1988: 8.3 percent earned less than \$5,000; 23.6 percent earned between \$5,001 and \$10,000; 33.3 percent between \$10,001 and \$20,000; 16.7 percent between \$20,000 and \$30,000; 9.7 percent between \$30,001 and \$40,000 and 8.3 percent over \$40,000.

- **Artists' Costs.** Of 21 male Boston painters, sculptors and craftspeople and 41 females, virtually all pay less than \$2,500 in annual art-related expenses. Over three-quarters of male and female members of these professions pay less than \$400 a month for workspace (Table 7).

### New York

The artist population of New York City, according to the 1980 U.S. Census, was 112,954. Of these 15,640 were painters, sculptors, craft artists and artist printmakers. The number of all artists surveyed in New York totals 485, of which 290

were painters, sculptors and craftspeople. The 1980s saw a huge infusion of money in the for-profit art market arena with prices soaring for visual art. There was an explosion of East Village galleries and commercial spaces in Soho, Noho and Tribeca as the line between profit and nonprofit spaces became thinner. Museums asked avant-garde artists to donate one-of-a-kind objects for reproduction, coming perilously closer to commercial activity. Non-mainstream museums collaborated on shows featuring a range and breadth of artists new to many New Yorkers. New York was considered by many the seat of the art market.

- **Age.** The mean age for all New York painters, sculptors and craftspeople is 37.6 percent; the median age is 36.
- **Education.** Table 5 details the spread between males and females for college degrees for painters, sculptors and craftspeople, with 30 percent of the males and 46.8 percent of the females having college degrees. At the graduate level 53.8 percent of the males have graduate degrees, and 47.6 of the females.
- **Income as Artists.** Individual earnings as an artist look like this for 79 male New York painters, sculptors and craftspeople: 25.3 percent earning \$500 or less; 32.9 percent earning between \$501 and \$3,000; 12.7 percent earning between \$3,001 and \$7,000; 10.1 percent earning between \$7,001 and \$12,000; 8.9 percent earning between \$12,001 and \$20,000; 8 percent earning between \$20,001 and \$40,000 and 1.3 percent earning over \$40,000.

For 126 female New York painters/craftspeople, individual earnings look like this: 24.6 percent earning \$500 or less; 33.3 percent earning between \$501 and \$3,000; 17.5 percent earning between \$3,001 and \$7,000; 6.3 percent earning between \$7,001 and \$12,000; 10.3 percent earning between \$12,001 and \$20,000; 6.3 percent earning between \$20,001 and \$40,000 and 1.6 percent earning over \$40,000.<sup>11</sup>

- **Total Gross Income.** For all 79 male New York painters/craftspeople, total gross income in 1988: 7.6 percent earned less than \$5,000; 11.4 percent earned between \$5,001 and \$10,000; 34.2 percent between \$10,001 and \$20,000; 20.3 percent between \$20,001 and \$30,000; 17.7 percent between \$30,001 and \$40,000 and 8.4 percent over \$40,000.

For all 127 female painters/craftspeople, total gross income in 1988: 9.4 percent earned less than \$5,000; 18.9 percent earned between \$5,001 and \$10,000; 32.3 percent between \$10,001 and \$20,000; 21.8 percent between \$20,001 and \$30,000; 14.2 percent between \$30,001 and \$40,000 and 3.9 percent over \$40,000.

- **Artists' Costs.** Of 44 male New York painters, sculptors and craftspeople and 59 females, virtually all pay less than \$2,500 in annual art-related expenses. Of 77 males, over half pay less than \$400 a month for workspace, while over half of the 118 females pay less than \$400 per month for workspace (Table 7).

#### Artists Training and Career Project (ATC)-1990-91

- **Age, Gender, Ethnic Background.** The mean age for all painters and craftspeople from this 1990-91 survey, to which 960 painters and 301 craft

artists responded, is 43.1 for painters and 43.4 for craftspeople. (Standard deviation 11.5-12.3.) The median age is 41 for both painters and craftspeople. As to gender, 58 percent of the painters and 54 percent of the craftspeople are female, while 42 percent of the painters and 46 percent of craftspeople are male. Median age for male painters is 38 and for craftsmen, 42. Median age for female painters is 40 and for craftswomen, 41.

Regarding ethnic background, for painters 86 percent are white, fewer than 2 percent are American Indian, more than 2 percent are Asian, 3 percent are black, fewer than 2 percent are Hispanic and 5 percent are "other." For craftspeople, 92 percent are white, fewer than 1 percent American Indian, 1 percent each Asian and Hispanic, more than 1 percent black, and 5 percent "other."

- **Education.** Regarding degrees, 40.6 percent of the painters have a college degree and 42.5 percent a graduate degree; 38.3 percent of the craftspeople have a college degree and 33.6 a graduate degree. By gender, 33.4 percent of male painters and 45.7 percent of women painters, and 31.5 percent of male craftspeople and 45.2 percent of female craftspeople have a college degree; 45.6 percent of male painters, 34.2 percent of male craftspeople, 40.2 percent of female painters and 33 percent of female craftspeople have graduate degrees (Table 8).
- **Income as Artists.** For painters in 1990, 56 percent of the males and 62 percent of the females earned less than \$3,000 as artists, and 65 percent of the males and 78 percent of the females earned less than \$7,000 as artists. For craftspeople in 1989, 36 percent of the males and 39 percent of the females earned less than \$3,000 as artists and 47 percent of the males and 53 percent of the females earned less than \$7,000 as artists (Table 8).
- **Total Gross Income.** For male painters in 1990, 8.6 percent earned under \$5,000; 13.3 percent earned between \$5,001 and \$10,000; 25.1 percent earned between \$10,001 and \$20,000; 20.2 percent earned between \$20,001 and \$30,000; 14.4 percent earned between \$30,001 and \$40,000; 16.7 percent earned between \$40,001 and \$60,000 and 1.7 percent earned over \$60,000.

For female painters in 1990, more than one third earned under \$10,000; 26.7 percent earned between \$10,001 and \$20,000; 19.8 percent earned between \$20,001 and \$30,000; 10.8 earned between \$30,001 and \$40,000; 7.5 percent earned between \$40,001 and \$60,000 and 1.3 percent earned over \$60,000.

For male craftspeople in 1989, 11.5 percent earned under \$5,000; 6.1 percent earned between \$5,001 and \$10,000; 14.3 percent earned between \$10,001 and \$20,000; 17 percent earned between \$20,001 and \$30,000; 19.1 percent earned between \$30,001 and \$40,000, 32 percent earned over \$40,000.

For female craftspeople in 1989, 19.8 percent earned under \$5,000; 14.3 percent earned between \$5,001 and \$10,000; 21.8 percent earned between \$10,001 and \$20,000; 18 percent earned between \$20,001 and \$30,000; 11.1 percent earned between \$30,001 and \$40,000, 15 percent earned over \$40,000.

| Female                           | 4.40               | 7.80             | 13.20           | 18.70           | 16.20           | 39.70           |           |
| Craft Artists (total)            | 12.35              | 3.35             | 9.70            | 15.00           | 15.65           | 44.00           |           |
| Male                             | 11.50              | 2.80             | 9.70            | 15.10           | 15.00           | 45.90           |           |
| Female                           | 13.20              | 3.90             | 9.70            | 14.90           | 16.30           | 42.10           |           |

Table 9 shows total gross household income for these artists.

- **Professionalism.** In this survey 91.2 percent of the painters and 85.7 percent of the craftspeople consider themselves professionals. (See *Information on Artists Survey* on professionalism discussed earlier for criteria and definitions.)

### Artists and Jobs Questionnaire-1980

This study commissioned by the New England Foundation for the Arts will be briefly summarized here. Its findings are for 291 painters, sculptors and craftspeople from the Boston area.

**TABLE 9**  
**ARTISTS AND JOBS QUESTIONNAIRE (1980)**

| Income as Artists            |                |                    |                     |                       |                        |                        |                   |                 |
|------------------------------|----------------|--------------------|---------------------|-----------------------|------------------------|------------------------|-------------------|-----------------|
|                              | \$0-500<br>(%) | \$501-3,000<br>(%) | \$3001-7,000<br>(%) | \$7,001-12,000<br>(%) | \$12,001-20,000<br>(%) | \$20,001-40,000<br>(%) | \$40,001 +<br>(%) | Total Responses |
| All Artists                  | 43.00          | 24.50              | 13.15               | 9.60                  | 3.10                   | 5.15                   | 1.50              | 255             |

| Female                       |                | 23.40              | 36.40               | 31.20                 | 6.50                   | 1.90                   | 6.00              | 147             |
| Total Gross Household Income |                | \$0-5,000          | \$5,001-10,000      | \$10,001-20,000       | \$20,001-30,000        | \$30,001-40,000        | \$40,000 +        | Total Responses |
| All Artists                  |                | 5.45               | 20.40               | 24.90                 | 17.15                  | 17.00                  | 15.15             | 241             |
| Male                         |                | 5.10               | 22.20               | 22.20                 | 20.20                  | 14.10                  | 16.20             | 96              |
| Female                       |                | 5.80               | 18.60               | 27.60                 | 14.10                  | 19.90                  | 14.10             | 145             |

- **Age and Gender.** The mean age for 287 Boston painters/craftspeople is 37.3; the median is 34. For males, the mean age is 36.3; the median, 33. For females, the mean is 38.7; the median, 35.5
- **Education.** For male Boston painters/craftspeople 8.4 percent have a high school education; 28 percent some college; 45.8 percent a college degree and 57.9 percent a graduate degree. For females, 16.5 percent have some college; 47.4 percent a college degree and 62.9 percent have a graduate degree.
- **Income.** Income as artist and total gross income for Boston area artists is seen in Tables 6 and 7 and will not be detailed separately here. Analysts of the findings on income seemed shocked at what artists earn, commenting "Find out why these artists earn so little." Proof of such meager earnings: for half the males and almost one-third of these female artists worked a full year to earn under \$500 from their art.

### Discrepancies

Why is there a discrepancy between the findings of all these discrete surveys and the Census in the area of education? Recalling the definitional problems of the Census and examples of tattoo artists and cardpainters being included as painters, one can see how the numbers become inflated with people whose data cannot be accurate markers for a large segment of the arts, whose information seems to be out of sync with everything else known. In fact, most studies of artists during the last 10 years, outside of the Census, have clearly established the high degree of formal education, as well as its lack of corresponding income.

## Conclusion

Figures that emerge from non-Census data about painters and craft artists described here are closer to the Census figures for Professional Specialty Occupations. Information gathered from every independent U.S. study reviewed here indicates a huge discrepancy between what researchers have identified directly from artists, and results from the 1990 Census. This is an area warranting substantial further investigation.

Another important area for inquiry, and one that has rarely been addressed, is the income of artists who have abandoned art as an occupation compared to those who have stuck with it. In *Talent and Achievement*, the authors report that "for both men and women, the household income of those who had abandoned fine art by mid-life is higher than the income of those still involved."<sup>13</sup> In addition, the range of individual earnings for those artists who remained involved in fine art was \$500-\$80,000, "either a feast or a famine."<sup>14</sup> The ranges in Research Center Studies were similar.

Many characteristics of artists emerge which have been explored by independent researchers and which bear continued attention. The authors of *Talent and Achievement* note that of the artists they studied, "at least since their early twenties, young people interested in art show a remarkable determination to shape their own destiny."<sup>15</sup> In addition, they comment on art as a profession: "Art differs from other occupations in that artists must find their jobs within themselves...the modern artist is expected to develop the content and the rules of his profession from within. External signposts are few, and ambiguous..."<sup>16</sup> By focusing solely on measures like earnings and education, analysis of artists is limited to "conventional goals of affluence and status" in the "roles prescribed by society."<sup>17</sup>

What the discrete surveys offer is another view targeting the artist population more narrowly than the Census and suggesting additional ways of looking at how artists view their occupations. These surveys also identify other areas of inquiry that broaden the picture of the artist in society. Finally, they indicate the need for a regular survey of artists, if possible, by the National Endowment for the Arts, which combines the more relevant aspects of the Census with other areas of inquiry, some of which have been identified in this document.

Further investigation is needed to compare other data sets and sources to the Census findings, and to provide a broader landscape in which to think about artists in ways which are valuable to society, the government and to the artists themselves.

### About the Authors

Joan Jeffri is the founder and director of the Research Center for Arts and Culture at the School of the Arts at Columbia University, and the coordinator of the Graduate Program in Arts Administration at Teachers College, Columbia University. She is the author or editor of numerous studies on individual artists, as well as texts in the arts management field, including *Artsmoney: Raising It, Saving It, and Earning It* (University of Minnesota, 1989) and *The Emerging Arts: Management, Survival, and Growth* (Praeger, 1980). Her books on artists include a series of interview books: *The Actor Speaks*, *The Craftsperson Speaks* and *The Painter Speaks* (Greenwood, 1992, 1993, 1994). For nine years she was an Executive Editor of *The Journal of Arts Management and Law*.

Robert Greenblatt has worked as a consultant in communications, computer resources, survey design and analysis, and systems design for a diverse group of clients including Columbia University's Research Center for Arts and Culture, the American ORT Federation and the Palacio de Queluz in Portugal. He has taught mathematics, political science and quantitative research at Pace University, Brooklyn College, the State University of New York and Cornell University. He has a Ph. D. in Mathematics from Yale University.

### III. Employment and Earnings of Performing Artists, 1970 to 1990

by Ann O. Kay and Stephyn G. W. Butcher

#### Overview

Artists, as a group, participate in the economy in a way unparalleled by the rest of the work force. Most workers are involved in creating the daily necessities of life. But artists are different. They participate in the creation of the culture. From architects to dancers, authors to actors, sculptors to musicians, no other group's impact is more immediate and pervasive, creating work spaces, homes, music, books, magazines, ads, artwork, television programs and movies.

The significance of artists in the work force increased dramatically from 1970 to 1990. In 1970 artists numbered 736,960 or 0.9 percent of the experienced civilian labor force (Table 1). By 1980 artists' numbers had jumped to 1,085,693, growing

| TABLE 1<br>EXPERIENCED CIVILIAN, PROFESSIONAL SPECIALTY, ARTIST AND<br>PERFORMING ARTIST LABOR FORCES, 1970, 1980, AND 1990. |            |             |             |
|--|------------|-------------|-------------|
|  | 1970       | 1980        | 1990        |

47.3 percent over the decade. Part of this increase reflected the overall labor force growth due to baby boomers continuing to enter the labor force, and an increased number of women working. But the artist growth rate also reflected the increasing importance of the professional specialty occupations and the service sector in the U.S. economy. This trend continued during the 1980s, boosting the artist occupation numbers by 4.4 percent a year (Table 2). By 1990 there were more artists as a whole and as a proportion of the experienced civilian labor force and professional specialty occupations. The mixture of artist types changed during these two decades. Performing artists - actors/directors, musicians/composers and dancers - fell from 23 percent of all artists in 1970 to 18 percent by 1990. During this time, "word" artists and visual and design artists occupations grew faster. However, the number of performing artists still increased at an annual average rate of 3.3 percent from 1970

to 1990, surpassing the growth rate of the national and professional specialty labor force.

### Data Sources and Conceptual Issues

This report examines trends in the employment and earnings of performing artists and their geographic distribution from 1970 to 1990. It uses three sources for data: Census, survey and pension data. Each of these data sources has advantages and disadvantages which are discussed in the general introduction to this book and will not be repeated here.

The Census data used is not from the Census form sent to most households, but from the Census long form questionnaire which is sent to about 15.9 percent of U.S. households. The long form has detailed questions about work history: occupation, sector, industry, last job held, current labor force status, weeks worked last year, usual work hours last year and detailed income from last year. The Census makes this data available to the public in the form of various sample subsets which include all the information except that which would identify the individual or household that provided it.

Most of the analysis in this report is based, directly or indirectly, on the 5 percent PUMS or "Sample A" containing information on the population and households representing 5 percent of the total U.S. population (a subset of the 15.9 percent who received the Census long form). Since the 1980s, The National Endowment for the Arts has constructed "Artist Extract Files" from these PUMS files created by the Census. The Artist Extract Files (AEF) are subsets of the PUMS that cover all those persons in the PUMS who listed their occupation as one in the arts. The data for 1970 in this report are based on Muriel Cantor's *Employment Status of Performing Artists: 1970 to 1980* (Cantor, 1987) which used the AEF files. The 1980 and 1990 data are from the authors' analyses of the AEF files. In all cases the actual counts

which are the result of samples have been "normalized" to the actual Census counts for the occupation as a total.

The main difficulties with using Census data to study the performing arts occupations are conceptual. The conclusions reached throughout this report are indicative rather than definitive for several reasons. The Census classifies the occupation of a worker according to the job he or she had the week previous to Census Day, April 1. (Not all respondents fill out the form on April 1, but this report ignores such variations and denotes the reference week as "Census Week.") If the worker had more than one job, the one at which he or she worked the most hours determines the job classification. If the worker is unemployed or not in the labor force, the occupation is classified as the last one held by the person.

For performing artists, this can be problematic. With irregular work cycles and work availability, not all performing artists will be working in performing arts occupations the week before Census Day. If this is so, or if most of their hours that week were not at a performing arts job, then they are not counted as performing artists. While excluding those "career" performing artists, the Census by design will include some "hobbyists" who happened to have earnings from their performing arts hobby during Census week - further blurring the head count.

All of the employment and earnings information available from the Census becomes attached to the occupation in which the worker was classified. The Census does not clarify whether all the hours worked Census week were in an artist occupation, or if all the weeks worked or income received last year were in performing artist occupations. Therefore, when this report speaks of "actors' or dancers' earnings," not all the earnings will necessarily have come from acting or dancing.

### **Performing Artist Surveys**

The second source of information on performing artists used in this report is from national surveys conducted by Ruttenberg et al. in 1977 and 1980. Members of the largest performing arts unions were surveyed about their careers and specific problems they experienced in the labor markets. Questions were tailored to the performing arts and therefore elicited answers much more illustrative of the work experience of such artists.

The main disadvantage with the surveys is that the universe is restricted to union members and it is impossible to determine how their results compare with Census data where criteria for membership in a performing arts occupation differ. Because it is difficult to generalize the survey results to the performing artist labor force overall, the surveys are used mostly to clarify points upon which the Census is silent.

### **Union Pension Records**

The third source of data used here is from pension and membership records for 1990 and 1992 from the three principal actors' unions: Screen Actors Guild (SAG),

Actors' Equity Association (AEA) and American Federation of Television and Radio Artists (AFTRA). (AFTRA excluded data on non-actor occupations represented by the union.) The American Federation of Musicians (AFM), the primary musicians' union, also provided some pension information on average earnings. These unions and the AFL-CIO Department for Professional Employees cooperated in producing this data, which contains no personal identification information on individuals.

The pension and membership data show wage earnings solely from acting work, unlike the Census. As with the surveys, the universe is restricted to union members. However, through judicious use, these records supply a piece of the picture that is missing in Census data on performing artists. Using all the information available, it may not be possible to see the entire picture, but its outlines will be more clearly discernible.

## Employment and Earnings Analysis

To identify trends in the performing arts occupations, this report examines the employment and earnings characteristics of these artists. In chief, these characteristics are labor force status, geographic distribution, class of employment, industry of employment, hours worked last week and usual hours last year, weeks worked last year and earnings. This study works with two universes. The first is based on current labor force status as of Census Week: employed, unemployed and not a participant. This universe or subsets of it will be used for geographic distribution, class of employment and industry of employment. The second universe is based on the work history for the previous year, regardless of whether the individual was employed, unemployed or not in the labor force at Census time. This universe is used for all characteristics based on the year previous to the Census, weeks and hours of work and earnings. (This second universe offers a richer data source than the one limited to Census week.)

Each of these economic characteristics will be examined as of the 1990 Census and then, using the 1970 and 1980 Censuses and other data, the trends will be described.

For the 1980 Census the Bureau of the Census created a new category of actors and directors to replace the former actors category. Although this means comparable data are not available over the entire 20-year span for actors-directors, some interesting trends are nonetheless brought to light.

It bears repeating that Census counts are probably undercounts of the numbers of performing artists. Based on the Census long form questionnaire, the respondent's occupation is the one in which he or she had worked the most hours the week prior to the Census. In 1980 Ruttenberg et al. found that the preponderance of all performing artists, except dancers, held jobs outside the performing arts and worked more in those other jobs (Ruttenberg et al., 1981; pp. 64, 81).

### Labor Force Status

In 1990 the Census counted 109,573 experienced civilians in the labor force working in the actors and directors occupation, about 39 percent of all performing

artists in the labor force (see Table 3). This represented a 63 percent increase over 1980 and a 173 percent increase since 1970. (The estimated number of actors and directors for 1970 is 40,201.) As with all of the performing arts occupations, the number of actors and directors in the labor force grew less rapidly in the 1980s than in the 1970s, although faster than the total experienced civilian labor force in general and professionals specifically. On an average annual basis, actors and directors increased by 5.3 percent per year during the 1970s and 5.0 percent during the 1980s. This slowdown was the smallest decline in growth rates for any performing arts occupation.

Source: Ellis and Beresford, 1994.

Dancers, the smallest performing artist occupation (7.9 percent of performing artists in 1990), nearly tripled their numbers during these 20 years. The number of dancers grew at 5.9 percent per year in the 1970s and 5.2 percent in the 1980s, so that by 1990 their numbers had increased by 196 percent, from 7,404 in 1970 to 13,194 in 1980 to 21,913 in 1990.

The slowest growth rate—and the most dramatic trend—occurred among musicians and composers (the Census group which also includes singers). In 1970 the experienced civilian labor force included 99,533 musicians and composers, the largest group (68 percent) of all performing artists. In 1980 their numbers had increased to 140,556 for a growth rate during the 1970s of 3.5 percent per year. During the 1980s, however, the growth rate had slowed to merely 0.5 percent per year so that by the 1990 Census, musicians and composers had added slightly less than 8,000 new labor force participants (148,020 musicians and composers in 1990). This was the lowest growth rate of any artist occupation during the 1980s. By 1990 the proportion of performing artists who were musicians and composers fell to 53 percent.

### **Unemployment Rates**

Throughout the period of this study, performing artists' unemployment rates exceeded those of the civilian workforce as a whole. Of the three groups, actors and

directors consistently had the highest unemployment rates; their rate in 1990 of about 13 percent was well over twice the national rate of 5.3 percent. Dancers were unemployed at a rate of 7 percent in 1990, while the rate for musicians and composers was 6 percent. For performing artists as a whole, unemployment that year was 8.8 percent.

Each of the three performing arts groups had its own distinct unemployment trends during this 20-year period. For musicians and composers, unemployment rose from 6 percent in 1970 to 8 percent in 1980 and then fell to 6 percent in 1990. Their rate showed the same trend as the national labor force's unemployment rate, which rose from 5 percent in 1970 to 7 percent in 1980 and fell to 5 percent in 1990.

For dancers, on the other hand, unemployment rates have declined. Starting at 14 percent in 1970, more than double the national rate, dancers' unemployment dropped to 11 percent in 1980 and to 7 percent in 1990. This was only two points above the 1990 national rate. (Because of the small number of dancers in the sample, this difference could be statistically insignificant.)

Unemployment trends of actors and directors are more difficult to pin down. In 1970 when actors were a separate occupational group, their unemployment rate was 32 percent—extremely high compared to the other groups. When directors were combined with actors for the 1980 Census, the rate dropped to 15 percent. For actors alone, the rate could have gone up or down. The Current Population Survey put the 1980 unemployment rate for actors alone at about 35 percent. However, the small CPS sample size for groups like actors and directors can distort the findings. This information indicates that directors have steadier employment than actors.

### ***Length of Time Since the Unemployed Last Worked***

Along with a decline in unemployment rates, the length of time since unemployed actors, directors and dancers last worked fell in the 1980s. In 1990, 65.2 percent of actors and directors who were unemployed at the time of the Census (April 1st) had been employed at some time that year. Nearly one-third, however, had been unemployed since sometime in 1989. Fewer than 3 percent had not worked for two years (since 1988) and only 1.5 percent had not worked for three to five years (since 1985 to 1987). This showed slight improvement over findings of the 1980 Census when 61.1 percent of unemployed actors and directors had been employed at some time between January 1st and April 1st, 1980; 33.4 percent had last been employed during 1979; 3.5 percent had been out of work for two years and 2.0 percent had been without a job for three to five years (Table 4).

Unemployed dancers saw an even stronger downward trend in the length of time since they had last worked. As of April 1, 1990, 68.0 percent of the dancers who were out of work had been unemployed for less than three months, compared to 57.1 percent of unemployed dancers 10 years earlier. The proportion who had not worked since sometime in the year prior to the Census dropped from 35.7 percent in 1980 to 24.3 percent in 1990. The proportion unemployed for two to five years was roughly unchanged: 7.1 percent in 1980 to 7.6 percent in 1990.

| TABLE 4<br>AMONG UNEMPLOYED PERFORMING ARTISTS, WHEN DID THEY<br>LAST WORK? AS OF APRIL 1980 AND 1990 |       |       |
|---|-------|-------|
| Unemployed as of April 1,   | 1980  | 1990  |
| <b>Unemployed actors and directors who last worked...</b>   |       |       |
| This year   | 61.1% | 65.2% |
| Last year   | 33.4% | 30.6% |
| Two years ago   | 3.5%  | 2.7%  |

| Source: 1980 and 1990 PUMS.   |       |       |
| *Less than 0.05%  |       |       |

Although musicians and composers had consistently lower unemployment rates than the other performing artists, those who were out of work tended to remain so longer. In 1990, 12.9 percent of jobless musicians and composers had been unemployed for two to five years, compared to 4.2 percent for actors and directors and 7.6 percent for dancers. For musicians and composers, this was an increase in the numbers experiencing long term spells of unemployment. In 1980 the proportion with two or more years of unemployment had been only 8.3 percent. Additionally, there was a shift from unemployed musicians and composers who had worked during the Census year (64.6 percent in 1980; 55.7 percent in 1990) to those who had not worked since the year before the Census (27.1 percent in 1980; 31.4 percent in 1990).

### ***Discouraged Workers***

A person is counted as in the labor force only if he or she is employed, unemployed and looking for work, or has been laid off and is awaiting recall. Of those classified as "not in the labor force," most are retired or working in the home. Others may be in school, ill or not in the labor force for other reasons. One reason is often "thinks no job is available," the discouraged worker. Unfortunately, information on discouraged workers is not available from the Census data. However, for 1980 Ruttenberg et al. found that 6 percent of all actors surveyed (including those who might be classed by the Census as not in the labor force) were discouraged workers. For singers, the rate was 7 percent; musicians, 5 percent and dancers, 3 percent (Ruttenberg et al., 1981: p. 161).

### ***Spells of Unemployment***

Concentrating on the labor force status at a point in time may be misleading; it certainly gives an incomplete picture. A performer may be employed at Census time, but this says nothing about his or her experiences in the labor market over time. According to the Ruttenberg survey, during 1980, 69 percent of actors, 64 percent of singers, 38 percent of musicians and 77 percent of dancers experienced some period of unemployment (Ruttenberg et al., 1981; p. 131). Nationally, only 18.1 percent of those in the labor force experienced or were experiencing a period of unemployment in 1980 (BLS, 1989).

Not only did most performing artists have some period without pay during 1980, but they also tended to have multiple periods of unemployment. In 1980, 63 percent of actors, 49 percent of singers, 56 percent of musicians and 30 percent of dancers who were not employed experienced three or more periods without any work during the year, either as performers or in secondary jobs (Ruttenberg et al., 1981; p. 144). By contrast, only 13.1 percent of those in the total work force who had a jobless period in 1980 experienced three or more periods without work. Additionally, the majority of the unemployed performers (except for dancers) did not receive unemployment compensation.

### **Class of Worker**

The Census defines the nature of a worker's employer as the worker's "class" of employment. The classes are private employer, self-employed, government or unpaid family work. Throughout this century there has been a trend in the U.S. away from self-employment toward wage and salary work in private firms, and more recently, in federal, state and local government. Performing artist occupations, however, deviate from the national trend. In 1990 of the 255,031 employed performing artists counted by the Census, 65.8 percent were wage and salary employees of private firms, 4.1 percent were government employees and 29.9 percent were self-employed (compared to only 8.6 percent of self-employed working civilians in the labor force overall). Of self-employed performing artists, 69.9 percent were musicians and composers, 24.8 percent were actors and directors and 5.3 percent were dancers.

For actors and directors, 20 percent were self-employed in 1990, compared to 17 percent in 1980. In 1970 only 11 percent of actors alone were self-employed; the difference implies that directors are more likely to be self-employed than actors.

In 1990 dancers were also 20 percent self-employed, representing a five-fold increase over 1970 when only 4 percent were self-employed. They were, however, less likely than actors and directors to hold government positions. Dancers had the largest increase in the numbers of self-employed workers.

Musicians and composers were the most likely to be self-employed in each Census, with 24 percent self-employed in 1970, 36 percent in 1980 and 38 percent in 1990. However, the unemployed among musicians and composers were more likely to describe themselves as self-employed; 47 percent of this group who were out

of work described themselves as self-employed, compared to 38 percent of those who were employed.

Persons in other classes of work are also classified as unemployed when laid off because their employer cannot find buyers for the firm's goods or services. This is not much different from the self-employed musician who cannot find a gig.

### Industry of Employment

It should come as no surprise that the majority of all performing artists were employed in the service sector of the U.S. economy. In 1990 "entertainment and recreation services" employed 51 percent of actors and directors, 68 percent of dancers and 48 percent of musicians and composers. Within that sector of employment, the main industry was "theatres and motion pictures" which employed 51 percent of actors and directors, 32 percent of dancers and 45 percent of musicians and composers in 1990. For actors and directors, "communications" was the other principal sector of employment, specifically, "radio and television broadcasting and cable," which employed 32 percent of actors and directors in 1990. Next largest industry was "colleges and universities," which employed 5 percent of all working actors and directors.

For dancers, the other significant industries of employment were "miscellaneous entertainment and recreation services" (35 percent) and "eating and drinking places" (22 percent). "Eating and drinking places" fall within the retail sector, which overall employed 23 percent of all dancers, including 1 percent in "hotels and motels." The prominence of eating and drinking places as a major employer of dancers probably reflects the diversity of this category which includes ballet, tap dancers, choreographers, go-go and "exotic" dancers.

Musicians and composers were the next most likely, after actors and directors, to work in the "theatres and motion picture" industry. The next largest employers of musicians and composers were "religious organizations" (25 percent) and "eating and drinking places" (7 percent). That last figure appears to represent a reversal in the growth trend for musicians in "eating and drinking places." In 1970, 10,363 or 11 percent of musicians and composers were employed in that industry. By 1980 "eating and drinking places" employed 11,558 musicians and composers. But all the gains and more disappeared by 1990 when only 9,769 musicians and composers worked in that industry—a decline of almost 6 percent in the 20-year period. This decline could in part reflect the difficulty the Census has identifying musicians when they work part-time or intermittently in their profession. But it appears to be a factor in the overall decline in the musicians' labor force growth rate.

An even larger factor in the declining growth rate for musicians and composers appears to be the sharp decline in the number employed in "theatres and motion pictures" between 1980 and 1990. In 1980, 68,468 musicians and composers or 53 percent had work in this industry. By 1990 the numbers had dropped to 62,614 individuals and 45 percent. This was a sharp reversal of the 77 percent growth musicians and composers enjoyed in this industry in the previous decade. An

explanation for this trend may lie in the increased availability of electronic substitutes for live performers in the music field during the 1980s, such as sophisticated recording and sampling technologies.

Perhaps one of the most interesting changes in industrial employment for performing artists resulted from combining the actor-director category and the concomitant rise in importance of cable television. In 1970, 70 percent of all *actors* worked in the "theatres and motion picture" industry and only 6 percent in the "radio and television broadcasting and cable" industry. By 1980 the proportions had changed to 51 percent of actors-*directors* employed in the "theatres and motion picture" industry and 34 percent in the "radio and television broadcasting and cable" industry. In 1990 these proportions were little changed (51 percent and 32 percent).

### Weeks of Work and Usual Weekly Hours

The Census asks respondents if they worked at any time during the previous year for a wage. Having worked last year forms the organizing principle for employment and earnings characteristics of performing artists in the following sections.

The number of performing artists increases significantly when the focus shifts from the currently employed (as of Census Week) to those who worked at all the previous year. In 1990, 255,031 performing artists were employed at the time of the Census, but almost a quarter more (310,925) had worked sometime the previous year. Workers in general cycle between employment, unemployment and not in the labor force due to a host of personal and economic circumstances. Performing artists appear more likely to experience this cycling than most other workers. When the focus shifts from the current to the previous year, a problem is uncertainty that the current occupation is the same as last year's.

Among actors and directors who had any work in 1989, 53.6 percent worked 50 to 52 weeks during the year. At the other end of the spectrum 23.5 percent worked 26 or fewer weeks. This was an improvement over 1979 when 48.3 percent worked a full year and 27.7 percent worked less than half a year. In 1969, before directors were included in this category, only 21.7 percent of actors worked a full year, while 41.2 percent worked less than a half year. In fact, in 1969, nearly a quarter of all actors worked 13 or fewer weeks. Improvements for actors and directors from 1970 to 1990 have resulted largely from changing the definition of the category in 1980, as directors clearly have steadier employment than actors. The median number of weeks worked by actors and directors in 1989 was 50, up two weeks from 1979.

Dancers were the least likely in 1989 to work a full year. Only a third of all dancers who had any work that year worked 50 to 52 weeks. This represented some progress as only 29.5 percent of dancers worked a full year in 1969 and 28.3 percent in 1979. Dancers were also more likely than other performers, although marginally so, to work less than half a year in 1989. Of all dancers who worked in 1989, 27.2 percent worked 26 or fewer weeks, a slight improvement over 1979 (33.3 percent) and 1969 (31.1 percent). The median number of weeks worked in 1989 was 39, the lowest for performing artists.

Nearly half of all musicians and composers who worked in 1989 (46.1 percent) worked a full year, which was up from 39 percent in 1969 and a similar proportion in 1979. In 1989 the median number of weeks worked by musicians and composers was 48, up by six weeks from 1979 (data for 1969 is not available). Taken together, the data for musicians and composers paint a picture of a labor market that is using its employed workers more intensively (more weeks worked and longer spells of unemployment) compared to other performers.

For most occupations, less than 35 hours a week is considered to be part-time employment. By this measurement, of musicians and composers who worked in 1989, 43.8 percent worked full-time and 56.2 percent part-time (Table 5). This represented a trend toward less part-time work for musicians and composers, 63.0 percent of whom worked part-time in 1979. (1979 data not available.) It is impossible to say whether this trend may represent an increase in hours worked at non-performing arts related jobs.

Source 1990 PUMS.

Dancers experienced a relative decline in full-time employment as measured by usual weekly hours from 1979 to 1989. In 1979, 56.0 percent were employed full-time and 44.0 percent part-time. By 1989 the proportions had changed to 50.4 percent working full-time usual weekly hours and 49.6 percent part-time.

For actors and directors, those employed full-time increased slightly from 74.6 percent working full-time hours in 1979 to 77.2 percent working full-time hours in 1989. When actors and directors worked, they were more than twice as likely as other performers to work long hours; 37.4 percent had more than 40 hours in a typical week in 1989.

Because it will be important later when earnings are discussed, Table 5 brings together the discussion of weeks and usual weekly hours worked by performing artists in 1989. It is interesting to note that whether actors and directors are employed part- or full-year, they are more likely to work full-time—35 or more hours a week. For dancers, musicians and composers, part-year workers are more likely to work part-time and full-year workers to work full-time. This has a significant effect on earnings

levels for these occupations, as will be shown.

The Census does not answer the question that is probably foremost in the mind of those interested in the labor market experiences of performing artists: how much of the work reported in the Census is in the performing arts and how much is in other jobs? Most performing artists are multiple jobholders. Sixty-four percent each of actors and singers, 73 percent of musicians and 37 percent of dancers held jobs outside of the performing arts in 1980 (Ruttenberg et al., 1981; p. 81). In contrast, only 5.2 percent of all workers nationwide held multiple jobs in 1970, 4.9 percent in 1980 and 6.2 percent in 1989 (Stinson, 1990; p.4). In 1991 the multiple job-holding rate for managerial and professional specialty workers was 7.3 percent, the highest rate among the major occupational groups, but not as high as rates for performing artists (Census, 1992). The most frequent reasons performers gave in 1980 for working outside performing arts were (1) there was not enough performing arts work and (2) the outside work supplemented their income from the performing arts.

The Ruttenberg study found that in 1980 actors were the most likely to have worked 50 days or fewer in performing arts (61 percent). (For a regular eight hour work day and five day work week, the usual number of days with pay is 260 per year.) Singers tended to have more performing arts work than actors; only 31 percent worked 50 days or fewer. Thirty-four percent of musicians worked 50 or fewer days in their field. Dancers had the most work time in a performing arts job. Only 19 percent of dancers worked 50 days or less, but 47 percent worked over 250 days, giving dancers the highest proportion with roughly full year employment in the performing arts. Only 5 percent of actors, 8 percent of singers and 12 percent of musicians worked as much as dancers in performing arts jobs (Ruttenberg et al., 1981; p.64). By contrast, Census data showed dancers the least likely to work a full year.

The differences might arise from small sample sizes in both data sources: the mixture of types of dancers in the Census and the union status of dancers in the Ruttenberg study. They may also reflect that actors and musicians are more likely than dancers to get supplemental work outside their performing arts profession, thereby boosting the number of weeks they report employment relative to dancers. The Ruttenberg study reported that of those who held a job outside the performing arts, 47 percent of actors worked 100 or more days in that job and 17 percent worked over 250 days in 1980. The proportions for singers were even greater: 59 percent worked over 100 days. Fifty percent of musicians worked 100 or more days in their other jobs. Dancers, the least likely to have a job outside the performing arts, also worked less in those jobs when they did have them: only 22 percent worked more than 100 days in their non-performing arts jobs (Ruttenberg et al., 1981; p.116).

## Earnings

Clear-cut information on performing artists' incomes is difficult to come by, due to multiple job holding, irregular hours and periodic joblessness, with and without unemployment compensation.

Data on income by type is available in the Census data. In the Artist Extract Files, which are derived from the Census, the data for each person include income from wages and salaries, non-farm and farm self-employment, retirement, interest and dividends, public assistance and "other" sources. Interpreting this income information for performing artists is not easy. The breakdown of wages between performing arts work and/or a support job cannot be known. Interest income could be residual or royalty income from a recorded performance or interest from a checking account. Caution is called for when interpreting the data.

Union pension records, on the other hand, show wage and residual income from performing arts work only. However, they may not represent all of a person's earnings in the performing arts field, and they lack data on earnings from jobs outside the field. Neither do they include precise information on how much work time the earnings represent. (The union pension records do include weeks worked, but according to the standard practice, one to seven days worked in a seven day period is recorded as a full week of work. This system makes it difficult to tell who is actually working more than whom.) Also, information on labor force status comparable to that found in the Census and CPS is lacking.

Despite the shortcomings of the Census and pension data, a great deal can be said about the earnings of performing artists.

### ***Median and Mean Earnings***

The last three Censuses have recorded ever higher earnings for each group of performing artists. In 1969 actors had median earnings of \$5,936; dancers, \$3,332 and musicians and composers, \$2,958. By 1979 the median earnings of dancers increased 62 percent to \$5,404 and musicians and composers 88 percent to \$5,561. These increases, however, were outpaced by the 98 percent rise in average consumer prices in the U.S. from 1969 to 1979.

Data for actors and directors are not available for 1969 because directors were not included with actors in the 1970 Census. In 1979, however, the median earnings of actors and directors were \$12,564, an increase of 111.7 percent over actors alone in the 1970 Census. Clearly the merging of directors with actors in the 1980 Census boosted the earnings of the group relative to actors alone.

By 1989 the median earnings of performing artists were higher: for actors and directors, \$22,000 (up 75 percent from 1979); for dancers, \$8,500 (up 57 percent) and for musicians and composers, \$9,900 (up 78 percent). Average prices increased by 68 percent during this time, so for all performers except dancers their median earnings outpaced inflation. (See Table 6.)

The mean earnings of performing artists also increased from 1979 to 1989, but at a higher rate than inflation. Additionally, mean earnings were higher than median earnings, which showed some individuals' earnings were much higher than the rest of their group's earnings. The mean earnings of actors and directors were \$16,498 in 1979, or 31 percent higher than median earnings; by 1989 they had increased to \$32,261 (up 96 percent), with the difference between the mean and median or

| Actors & directors               | na      | \$12,564 | \$22,000 | na             | 75.1%   |
| Dancers                          | 3,332   | 5,404    | 8,500    | 62.2%          | 57.3%   |
| Musicians & Composers            | 2,958   | 5,561    | 9,900    | 88.0%          | 78.0%   |
| Inflation (CPI W, 1982/84 = 100) | 36.9    | 73.1     | 122.6    | 98.1%          | 67.7%   |

Sources: NFA Research Division Note #10 "Artists Real Earnings Decline 37 Percent in the 1970's," Washington, DC, March 5, 1985, and Artist Extract File for 1990 Census

spread increased to 47 percent. This growing spread indicates that the earnings of the highest paid members of the professions, perhaps "superstars," increased faster than earnings of the profession as a whole. (See Table 7.)

The same trend held for dancers, musicians and composers. For dancers, their mean earnings were \$7,062 in 1979 and increased by 72 percent to \$12,152 in 1989. Musicians' and composers' mean earnings were \$16,233 in 1989, an increase of 105 percent over their mean earnings of \$7,923 in 1979. The spread also increased. In 1979 the mean was 31 percent higher than the median for dancers' earnings, but 43 percent higher in 1989. For musicians and composers, the spread increased from 43 percent in 1979 to 64 percent in 1989.

### ***Distribution of Earnings***

Single numbers like the mean or median do not tell the whole story of how well or poorly performing artists have done in the labor market at each point in time. For example, in 1989 about 1 percent of all performing artists earned zero or less (Table 8). Twenty-four percent of actors and directors, 53 percent of dancers and 49 percent of musicians and composers earned less than \$10,000 in 1989—from all work. The similarities in earnings distributions for performing artist occupations end there. Actors and directors are much more evenly spread out in terms of earnings and consistently earn more than their dancer or musician peers. About three-quarters of

Source: 1990 PUMS.

dancers, musicians and composers earned less than \$20,000 in 1989, but less than half of all actors and directors who worked in 1989 earned less than \$20,000. At the other end of the earnings distribution, 13 percent of actors and directors (1 in 8) earned \$60,000 or more in 1989, but only 1.3 percent of dancers (1 in 80) and 3.9 percent of musicians and composers (about 1 in 25) earned that much the same year.

Although actors and directors were the most likely to earn in the higher brackets in 1989, the distribution of earnings improved during the 1980s for all performing artist occupations as seen in Tables 9, 10 and 11 for 1979 and 1989. Data for 1969 are not available for earnings distributions.

The earnings distribution shifted markedly for actors and directors between 1979 and 1989. The proportion earning less than \$10,000 during the year decreased from 44 percent in 1979 to 24 percent in 1989. The proportion who earned at least \$10,000, but less than \$20,000, also decreased, from 28 percent to 20 percent. At the other end of the earnings distribution, every interval above \$20,000 increased its share of actors and directors earning in those ranges. The proportion of actors and directors with the highest incomes, \$60,000 or more, grew the most, increasing from 5 percent in 1979 to 13 percent in 1989.

An upward shift in the earnings distribution also occurred for dancers during the 1980s. In 1979, 75 percent of dancers earned less than \$10,000, but by 1989 the proportion of dancers in that range had fallen to roughly 50 percent. More than a quarter earned between \$10,000 and \$19,999 in 1989, compared to less than 20 percent earning in that range in 1979.

The distribution of earnings for musicians and composers also improved between 1979 and 1989. The proportion earning less than \$10,000 fell from 71 percent in 1979 to about one half in 1989. The proportion earning \$30,000 or more increased substantially from 3.6 percent in 1979 to 15.3 percent in 1989.

**Full-time versus Part-time Earnings**

A number of variables affect earnings. The number of hours worked per week and the number of weeks worked per year are major factors determining the level of earnings. To simplify this analysis, performing artists are grouped according to whether they worked part-time and part-year (less than 35 hours per week, less than 50 weeks per year) or full-time and full-year (35 or more hours per week, 50 weeks or more per year). As Table 12 shows, these differences have a dramatic effect on earnings.

| TABLE 12<br>FREQUENCY DISTRIBUTION OF PERFORMING ARTISTS WHO<br>WORKED IN YEAR PREVIOUS TO CENSUS, BY EARNINGS AND BY<br>PART/FULL TIME AND PART/FULL YEAR WORK STATUS, 1989<br>EARNINGS FROM 1990 CENSUS. |                          |                          |                          |                          |                          |                          |

Source: 1980 and 1990 PLAMS.

For all performing artist occupations (without regard to hours or weeks worked), the most common earnings interval was the \$0 to \$9,999 range (Table 8, earlier). When part-time and part-year artists are separated from full-time and full-year artists, the most prevalent interval for part-time and part-year artists continues to be the \$0 to \$9,999 interval, with 65 percent of actors and directors, 76 percent of dancers and 71 percent of musicians and composers (Table 12). Interestingly, the proportions of all performing artists earning \$0 to \$9,999 are closer for all three occupations when just part-time and part-year workers are examined. Clearly, some of the earnings differences between actors and directors and the other two groups discussed above arise from differing proportions of part-time workers (Table 5, earlier).

For full-time and full-year work, the most prevalent range for performing artists overall is \$10,000 to \$19,999. Twenty percent of actors and directors, 42 percent of dancers and 29 percent of musicians and composers earn in this range. Notably, substantial proportions of all performing artists who work full-time, all year earn in the higher ranges. For example, when all performing artists are considered, 18

percent of actors and directors and 13 percent each of dancers, musicians and composers earned in the \$20,000 to \$29,999 range. When only full-time, full-year workers are considered, however, about a quarter of each group had earnings in this range.

Much has been made of the low levels of performing arts earnings and the fact that median earnings generally have failed to keep pace with inflation. In analyzing the meaning of available data on their earnings, though, it is important to keep that data's limitations in mind.

One problem is the temptation to analyze Census data as if the performing artists recorded in the 1970 Census are the same ones recorded in the 1980 and 1990 Censuses. This is not the case. As noted earlier, the performing artist labor force has increased substantially over the last 20 years, faster than the labor force in general. This suggests that the performing artist labor force has a greater proportion of new and relatively inexperienced workers, and these less experienced performers might inflate the lower end of the earnings distribution. Those just starting out will earn little and if they don't make it will likely drop out of the performing arts work force to pursue another career. Those who do make it will probably see their earnings rise over time. By the next Census, the discouraged performers are accounted for in different occupations and a new, larger group of aspiring performers are now counted in the performing artist labor force. The Census data will reflect the successes of performing artists who have found steady work by showing a shifting of the earnings distribution toward higher incomes.

Generally, researchers have found that performing artists earn less than other professionals with similar experience and education. However, Ruttenberg et al. found in 1980 that 50 percent of actors, 42 percent of singers, 49 percent of musicians and 23 percent of dancers received less than half of their income from performing arts work (Ruttenberg et al., 1981; p. 182). Thus it cannot be assumed that earnings of performing artists reported in the Census are from performing arts work alone and that as professionals, their earnings suffer in comparison to those of other professionals. What may suffer is the availability of steady employment as a performing artist relative to other professionals. It cannot be demonstrated using Census data that the artists' rates of pay are lower.

Another factor heavily influencing earnings is the artist's other occupation. The 1981 survey by Ruttenberg et al. found that of those with second jobs in 1980 over half the actors and singers, over a fourth of musicians and one third of dancers were in sales, clerical or service jobs—jobs with a history of low pay and benefits. Fewer than 15 percent held professional jobs as their supplementary occupation and the majority indicated that pay of their secondary job was less than their pay in performing arts. Most of those with a second job tended to choose those jobs that gave them the flexibility needed to pursue an arts career.

### ***Union Earnings from Pension Records***

This section examines wage and residual earnings information provided by the three main actors' unions from their pension records. These three unions represent most of the nation's professional actors who perform on stage, screen, television,

radio or video. Comparable data could not be provided by the two principal unions in the musical arts. This discussion will therefore concentrate on actors, except in the area of average earnings by source, where certain information is also available for musicians' earnings.

Data furnished by the actors' unions cover all members of the particular union who had worked anytime within the five years previous to 1990. The Screen Actors Guild (SAG) had data for 1992 only, while the other two unions, Actors' Equity Association (AEA) and American Federation of Television and Radio Artists (AFTRA), furnished data for both 1990 and 1992. (AFTRA's pension data used here excludes categories of members who worked in non-acting fields.)

The pension data was combined into two master files. The first file covers individuals with at least \$1 in earnings in 1992 who belonged to any of the three unions. The second file covers individuals regardless of earnings who were active members in both 1990 and 1992 of AFTRA and/or AEA. Both files contain, for each individual, the source of income by union and whether it was wage or residual income; however, neither file included personal identifying information. The category of wage income in these pension data files corresponds to the wage and salary income category of the Census. However, an actor's residual income would have been included in the Census as interest, royalty and dividends—a category that was not examined in the previous section on earnings information from the Census.

The first file, covering actors and extras of all three unions who earned at least \$1 in 1992, included 84,637 actors and extras (extras are included in the Census' actor/director category). As an indication of overlapping memberships, 56 of these actors and extras belonged to only one union, 31 percent belonged to two unions and 13 percent belonged to all three unions. The second file, which covers members of AEA and AFTRA who were active in both 1990 and 1992, includes 93,766 actors and extras. The differences between the two universes are (1) SAG members who are members of SAG only, (2) any actor/extra who earned nothing, and (3) active members in 1992 who were not active in 1990.

The Census and pension data are not strictly comparable, but their differences help point out some unique labor market problems faced by performers. The data are not comparable because (1) the Census has stricter inclusion criteria both for occupational and labor force status and (2) the Census data includes directors. Of those 84,637 union actors in the pension records, many were probably omitted from the tally of Census actors because they did not spend the majority of their work hours during Census Week working as actors. Similarly, there were probably other union actors who were out of the labor force altogether during Census Week. The Census' stricter criteria may help explain why the 1990 Census counted 109,573 actors *and directors*, while the union's figures for actors *alone* just two years later are about 28 percent higher.

### ***Earnings Distributions***

Based on the 1992 union data covering all 84,637 actors and extras with earnings, the vast majority (about 69 percent) earned less than \$10,000 per year from

wages and residuals (Table 13). The most comparable Census figures are from 1989 when only 24 percent of actors and directors reported earning \$10,000 or less. The differences lend support to the hypothesis that Census data on performers' earnings are more reflective of their non-performing arts work, and that combining actors and directors in the Census data has masked the labor market experiences of actors alone. This hypothesis is further supported by looking at the high end of the earnings distribution. In the 1989 Census data 13 percent of actors and directors earned \$60,000 or more, whereas only 6 percent of actors in the pension data earned that much.

### *Earnings over Time*

The pension data which covers only AEA and AFTRA members has information for the same 93,766 individuals in 1990 and 1992, providing a means to examine how individuals fare over time in the acting profession, albeit for a relatively short time.

Overall, the earnings distribution is fairly stable. Eighty-nine percent in 1990 earned less than \$10,000 per year and 87 percent earned less than \$10,000 per year in 1992. The distribution changed little at any earnings level.

What is masked in the distribution as a whole is the volatility of personal earnings between these two years. Of those without any earnings in 1990, 25 percent earned something in 1992—some going from “zero to 60” thousand or more in two years. Conversely, of those who had earned something in 1990, 18 percent earned nothing in 1992. Although more than half of the 93,766 earned nothing from their craft in both years, of the remainder about 50 percent earned more in 1992 and about 50 percent earned less. These statistics include actors whose earnings changed

within their range. Looking at the same earnings intervals, about one-third moved to a higher interval, about one-third stayed the same and about one-third dropped.

### *Source of Earnings*

Earnings levels also differ significantly by source. For SAG members alone, information was obtained from the pension records on the source of earnings for their members broken down as follows: actor versus extra, wages (from any and all employers) versus residuals and by type of performance (theatrical motion picture, television, TV commercial and industrial educational). The data are for 1992 (Table 14).

| TABLE 14<br>AVERAGE WAGES AND RESIDUALS FOR SAG MEMBERS,<br>BY TYPE OF WORK. 1992. |               |                   |                        |
|--|---------------|-------------------|------------------------|

| [1] Detail aggregated to preserve anonymity  |               |                   |                        |
| Source: SAG Pension Records.   |               |                   |                        |

The highest average wage was for actors with television work who earned an average of \$15,712 for the year (1992). The highest average residual was from TV commercial work, \$11,284. The lowest average wage was for extras in theatrical motion pictures, \$651, while extras earned the most in television and in TV commercials, about \$1,168. These averages probably show the same amount of variation as do earnings as a whole, but they do provide a clue as to why earnings vary so much. It may be that some types of work pay more, or simply that more work is available in those categories. The data cannot disclose which is the case.

Similar information is available from the American Federation of Musicians (AFM) which provided summary data on its members' average earnings by type of

performance from pension records covering 43,552 members in 1992. The highest average pay for musicians came from New York City theatricals, where average pay was \$15,164 for the year (Table 15). The lowest was for performances on network or commercial radio at \$680. Average earnings for TV firms were \$3,318 and motion pictures, \$5,638.

These data are essentially the total of all earnings from a particular source (e.g., TV commercials) divided by the number of performers with that kind of work. They are average earnings per person from that kind of work, not average earnings per performance. While it is not possible to tell from these data which types of performances paid better, these figures do show the extent to which each type of work is serving as a source of income for actors and musicians.

### Geographic Distribution

This section details, as much as practicable, where performing artists live and work, based on Census data. The Census defined regions are: Northeast, Midwest, South and West. Each region is composed of divisions of which there are nine: New England, Middle Atlantic, East North Central, West North Central, South Atlantic, East South Central, West South Central, Mountain and Pacific. Unless specifically noted to the contrary, actors and directors are included in the following 1970 data, unlike most of the preceding analysis.

**Distribution by Region**

In 1990 the West region of the United States had 36 percent of all actors and directors, more than any of the other three regions. In 1970 only 29 percent of actors and directors lived in this region, a virtual tie with the Northeast where 31 percent lived (Table 16). By 1990 the Northeast was close to the same number at 29 percent. The Midwest's share dropped from 18 percent of actors and directors in 1970 to 14 percent in 1990. The South remained essentially unchanged at 21 percent in 1990, up from 18 percent in 1980 but the same as in 1970.

| TABLE 16<br>DISTRIBUTION OF PERFORMING ARTISTS BY REGION OF<br>THE UNITED STATES, 1970 TO 1990. |      |      |      |

| West  | 24%  | 26%  | 26%  |

Source: Ellis and Beresford, 1994.

The pattern for dancers could not have been more different. The West employed 40 percent of all dancers in 1970, dropping to 32 percent in 1980 and to 28 percent in 1990. The major gainer was the South whose share of dancers in 1990 was 32 percent, up from 19 percent in 1970 and 25 percent in 1980. With minor fluctuations, the Northeast and Midwest had about the same proportion of dancers in 1990 as in 1970. In 1970 the Northeast was home to 24 percent, in 1990, 23 percent. The Midwest had 17 percent in both 1970 and 1990.

Musicians and composers followed yet another trend. While the Northeast incurred a slight loss in its share of musicians and composers and the West a slight gain over the 20-year period, the Midwest lost a substantial share, going from 25 percent in 1970 to 20 percent in 1990. The South was the major gainer. In 1970, 27 percent of musicians and composers lived there while 32 percent lived in the South in 1990.

The overall trend represented a shift in employment to the South for dancers, musicians and composers and to the West for actors and directors. However, no area

had a net loss of any performing artist group over the 1970 to 1990 period. The changes in proportion for all three groups are due solely to different rates of growth of the performing artist work forces within the regions.

### ***Distribution by Division***

At the level of Census division, the proportion of actors and directors who live in a particular area has been remarkably stable over the last 20 years. The notable exceptions are the Pacific region which increased its share from 25 percent in 1970 to 32 percent in 1990 and the West South Central region (Texas, Arkansas, Oklahoma and Louisiana) which decreased its share from about 10 percent in 1970 to about 5 percent by 1990. Again, these changes reflect solely different growth rates of the actor and director work forces in those areas.

If the last two decades were boom years for actors and directors in the Pacific area, they seem to have been bust years for dancers. The Pacific states' share of dancers shifted from 32 percent in 1970 to 19 percent by 1990. The other two areas with high concentrations of dancers in 1970 also saw their shares fall. In the Middle Atlantic states which include New York, the share fell from 22 to 19 percent over the 20-year period. In the North East Central states which include Illinois, the proportion of dancers fell from 15 percent in 1970 to 12 percent in 1990.

The big gainers in terms of dancer population were the South Atlantic (Maryland to Florida on the Atlantic seaboard) and the West South Central states (Texas, Oklahoma, Arkansas and Louisiana). From 1970 to 1990 the South Atlantic increased its share of resident dancers from 12 to 18 percent; the West South Central states, from 6 to 11 percent.

The geographic distribution of musicians and composers has remained fairly stable since 1970. The major shifts have been from the Middle Atlantic states (chiefly New York) to the Pacific and South Atlantic states. As with the other performing artist occupations, the changes in shares for musicians and composers reflect different growth rates.

### ***Unemployment by Division, 1990***

Nationally, in 1990 the unemployment rate for actors and directors was 13 percent; for dancers, 7 percent and for musicians and composers, 6 percent. However, in areas where the absolute numbers of performing artists are quite high, the unemployment rate also tends to be higher than the national average. Using a statistical test to determine the degree of trend, where 0 percent indicates no relationship and 100 percent indicates a full relationship, the degree to which the trend is true for actors and directors is 95 percent; musicians and composers, 59 percent and dancers, 50 percent.

Across occupations, four divisions consistently are home to over 10 percent of performing artists: Middle Atlantic, East North Central, South Atlantic and Pacific. The Middle Atlantic and the Pacific have consistently higher proportions of the

nation's performing artists and unemployment rates consistently higher than the national average. The Middle Atlantic had 24 percent of actors and directors in 1990 with an unemployment rate of 16 percent (compared to 13 percent nationally for performers). The Pacific had 32 percent of actors and directors with an unemployment rate of 20 percent. The trend holds for the other performing artists as well.

In contrast, the other two major divisions had unemployment rates lower than the national average. The East North Central had 10 percent of all actors and directors in 1990, but an unemployment rate of 6 percent, less than half the national rate. The same held true for dancers (12 percent of dancers, 6 percent unemployment rate) and musicians and composers (14 percent with 6 percent unemployment rate). In the South Atlantic division the unemployment rate for all three groups of performing artists was 5 percent.

### ***Geographic Concentration of Performing Artists***

Looking at the divisional level, it is clear that performing artists are concentrated in specific areas of the country. Most of those performing artists who lived on "one of the coasts" lived in the Pacific states (California, Oregon, Washington, Alaska and Hawaii) if they were in the West or the Middle Atlantic states (New York, New Jersey and Pennsylvania) if they were in the Northeast. In 1990, 56 percent of actors and directors lived either in the Pacific states (32 percent) or the Middle Atlantic states (24 percent). For dancers, musicians and composers, 38 percent lived on either coast. Moving to even greater detail, the New York City and Los Angeles metropolitan areas were the major areas of residence for performing artists. In 1990, 37 percent of actors and directors lived in Los Angeles or New York, with more in Los Angeles. For dancers, 16 percent lived in either city, with more in New York. For musicians, 16 percent lived in these two metro areas, with 8 percent in each.

In 1990, 60 percent of all employed actors and directors worked in just six states (California, New York, Texas, Florida, Illinois and Massachusetts). For employed dancers, 39 percent were concentrated in just four states (New York, California, Florida and Texas), and the same four states (with California first) provided work for 40 percent of employed musicians. The reverse side of this concentration finds 25 states providing only 10 percent of the work for actors and directors in 1990. Half of all states plus the District of Columbia offered employment for just 12 percent of the nation's dancers, including three states with no dancer employment reported. Sixteen percent of working musicians were spread among half of the states and the District of Columbia.

A significant trend over the last twenty years has been the increasing importance of the performing artist workforce in the South, notably dancers and musicians-composers. By 1990 nearly one third of the members of those two professions were concentrated in the South Atlantic division. The overall proportion of actors and directors in the South, on the other hand, stayed at about one out of five over the twenty years, despite a small increase in their percentage in the South Atlantic states.

## Conclusion

The most recent data from the Census and other sources discussed here leave little doubt that performing artists face a cluster of labor market obstacles, ranging from a shortage of full time jobs to a lack of steady income from their profession to the limited geographic areas where work is likely to be found. As a result, the talents and resources of the nation's performers are significantly underutilized. In the interests of promoting and nurturing the arts in this country, the government, through NEA, would seem to have a direct stake in improving the employment and earnings opportunities for performing artists.

An understanding of the work force needs of performing artists is shaped by the ability to observe and document those needs. This cannot be done with precision at present. The incidence of multiple jobs and income sources, and the on-again, off-again employment patterns common in this field complicate any analysis of the performers' work experience. The primary source of data, the Census long form questionnaire, is not designed to gather the detailed data needed to explain their situation. The authors therefore recommend that the NEA consider how to encourage the development of additional data sources which could include:

- (1) Special surveys of performing artists. The best way to overcome the gaps left by the Census and CPS questionnaires would be to develop a national survey of performing artists. This will require cooperation from performing arts unions, theatres, dance organizations and others with lists of members of employees from which the survey samples could be drawn. Longitudinal studies of performing artists as they pursue their careers would be of the utmost importance and interest.
- (2) Records of organizations in the field, including unions and performing arts organizations. Public and private cooperation should be sought in developing new data sources, building on existing resources of these organizations. As labor organizations in the field develop their own databases and computer capacity, the NEA should consider providing technical assistance to help them design data systems that will also meet national informational needs through easy accessibility and standardized record keeping that does not compromise the required level of confidentiality.
- (3) A special Current Population Survey questionnaire on performing arts employment. This should be administered periodically to obtain regular, current information from the general population on income and employment in performing arts occupations. This special CPS should include questions to identify persons who consider themselves performing artists and to differentiate between their arts related and non-arts related work and income.

Employment opportunities in the performing arts obviously depend on a sustained level of support for drama, dance and music. A continuing priority for the Endowment should be to undertake activities that encourage public and

private investment in the performing arts, as well as to develop and expand audiences. Special attention should be given to activities that will generate jobs and income for professionals in the performing arts.

### About the Authors

Ann Kay is a senior member of Ruttenberg, Kilgallon & Associates, a Washington, DC, based labor consulting firm. She coordinated the firm's 1980 survey of employment and earnings among members of performing arts unions, which resulted in the 1981 report, *Working—and Not Working—in the Performing Arts*. She has also conducted a variety of research and evaluation studies on other issues related to employment and skill development.

Steve Butcher is a doctoral candidate in economics at The American University in Washington, DC. He is also employed by Ruttenberg, Kilgallon & Associates where he consults for labor unions on a variety of issues including earnings and working conditions. His only direct experience with the performing arts was a junior high school performance in *Peter Pan* as Michael; it was panned by the critics.

## IV. Architecture and Design Arts Occupations, 1970 to 1990

by Harry Hillman Chartrand

### Overview

Architects and designers are the visual ecologists of our society. They cultivate the images and forms that shape the human environment, applying the insights and findings of the fine arts to our daily lives. They shape, color and mold the skylines of our cities, clothes, shopping centers, cereal packages, houses, furniture, TV sets, offices, factories, churches and temples of today's society. Architects and designers contribute what the ancient Greeks called *kosmos*: the right ordering of the multiple parts of the world.

Even the words and sayings of architects and designers form part of our contemporary vocabulary. It was Louis Sullivan, architect of the first skyscraper, the Wainwright Building in St. Louis (1890), who said, "Form follows function." Frank Lloyd Wright coined the phrase, "Organic architecture." Mies van der Rohe, godfather of the International Style, is credited with saying, "Less is more."

If architects and designers are concerned with the present, preservationists are dedicated to conserving the past—Williamsburg, for example—while planners are concerned with the shape of the future.

But who are these shapers of image and molders of form? What is their age, race, ethnicity, sex and education? Where do they live and work and how much do they earn? These questions will be addressed in this study.

### Evidence

Two principal sets of data will be presented and assessed. Of course, statistics cannot explore quality and excellence in architecture and design, but they do provide a means to understand the factual context from which quality and excellence emerge.

The first set of statistics is produced by the Bureau of the Census of the Department of Commerce, the National Center for Education Studies of the Department of Education, and the Bureau of Labor Statistics of the Department of Labor. Their advantages and disadvantages are discussed in the general introduction to this report. The second set of data is from membership organizations including the American Institute of Architects, the American Society for Landscape Architects, the Industrial Designers Society of America, the American Institute of Graphic Arts, and the American Planning Institute. Advantages and disadvantages of such data sets are also in the general introduction.

Both data sets have been primarily collected from databases and special studies conducted or commissioned by the Research Division of the National Endowment for the Arts. These include the biennial *Source Book of Arts Statistics*. In addition, a special data set was provided by Deirdre Gaquin of Washington (1990 Census of Population data).

### Difficulties

Definitional difficulties occur when comparing Census of Population data with that from the Bureau of Labor and from representative organizations. For example, the Census of Population's *Classified Index of Industries and Occupations* identifies 13 job titles for architects, including landscape architects. Census of Population data is presented for all 13 types of architects. In the case of Bureau of Labor Statistics data, architects and landscape architects are reported separately, as are data from the American Institute of Architects and the American Society for Landscape Architects. In all cases, however, marine and naval architects are excluded.

For designers, the situation is worse. The Census of Population for 1980 and 1990 identifies at least 98 occupational titles under "Designer," ranging from window trimmers to industrial designers to flower arrangers to fashion designers. By contrast, the *Occupational Handbook 1992-93 of the Department of Labor* formally defines six design occupations as follows: Industrial designers, interior designers, set designers, fashion designers, textile designers and floral designers.

The Bureau of Labor Statistics, on the other hand, distinguishes between designers, interior designers, and merchandising displayers and window trimmers. As well, distinct data is available for graphic and industrial designers from the representative associations. Educational data provide the finest degree of distinction between the various design disciplines.

In addition, Census of Population data for different years have been derived from different sample sizes. For example, data for the 1950 through 1980 Census (Citro and Gaquin 1987) are derived from a 5 percent sample, while some Census data for 1970 through 1990 (Ellis, Beresford 1994) have been derived from a 16.7 percent sample. Such differences can cause analysis to be somewhat jerky, bouncing from one data definition and sometimes sample size to another.

Regarding urban and regional planners and preservationists, no Census of Population data were available for purposes of this study, so no trend analysis was possible. Preservation is, at present, mainly a speciality practiced by architects, designers and planners.

### Trends

A "trend" refers to the general direction of a phenomenon over time. For purposes of this study, this means the general direction of demographic characteristics, education, employment and earnings of architects and designers.

When discussing trends for a demographic or economic variable, a convenient summary measure is the *average rate of growth*. Growth rates have three strengths. First, while one cannot compare apples and oranges, one can quite properly compare the rate of growth of apples and oranges. Second, growth rates, as a single number, provide a succinct summary of trends. Third, theoretically, growth rates can be used to project trends into the future, assuming the future reflects the past.

For purposes of this study, the *restricted least squares* method is used because it is considered the best single indicator of the trend.

### Comparative Occupational Groups

The general introduction to this NEA report on artists defines the three occupational groups of experienced civilian labor force (ECLF), professional specialty workers (PSW) and all artists.

Trends in architect and designer demographics, education, employment and income will be compared to these three groups.

Between 1970 and 1990, the experienced civilian labor force grew at an average rate of 24.3 percent each decade from 80.1 million to 123.5 million. In this same time period professional specialty workers grew at an average rate of 21.5 percent each decade from 11.7 million to 16.6 million workers. Between 1970 and 1990, all artists grew at an average rate of 57.1 percent each decade from 11.7 million to 16.6 million workers.

The number of architects between 1970 and 1990 grew at an average rate of 60.1 percent each decade from 56,125 to 157,759.

Until 1980, decorators and designers were recognized as distinct occupational categories in the Census of Population. Drawing upon Citro and Gaquin (1987), the distinction is maintained whenever possible. Between 1970 and 1990, decorators and designers grew at an average rate of 78.9 percent each decade from 185,954 to 600,810.

Decorators increased between 1970 and 1990 at an average rate of 82.1 percent each decade from 74,004 in 1970 to 240,800 in 1990. During this time designers increased at an average rate of 76.9 percent each decade from 111,950 in 1970 to 360,000 in 1990.

The total number of artists was 6 percent of all professional specialty workers in 1970 and had increased to 10 percent by 1990. Architects represented 0.5 percent of PSW in 1970 and then increased to 1 percent in 1990. Decorators and designers advanced from 1.6 percent of all PSW in 1970 to 3.6 percent in 1990.

As a percent of all artists, architects went from 5 percent in 1970 to 9.4 percent in 1990. During this time decorators and designers represented 27.7 percent of all artists in 1970 and 35.8 percent in 1990.

## Architects

### Definitions

To provide a basic understanding of architectural occupations, descriptions derived from the *Occupational Handbook 1992-93* (Bureau of Labor Statistics, 1993)

will be used for architects and landscape architects.

The *Handbook* notes that architects provide a variety of services to individuals and organizations from initial discussion with clients through constructions requiring a variety of skills including design, engineering, managerial and supervisory.

The architect and client must first discuss purposes, requirements and budget. Based on these discussions, the architect prepares a report specifying requirements and prepares drawings presenting ways to meet a client's needs.

After the initial proposal is accepted, the architect develops final construction documents showing the building's appearance, including drawings of structural systems (air-conditioning, electrical, heating, plumbing and ventilation) and sometimes landscape plans. Architects also specify building materials and sometimes interior furnishings. They must follow building codes, zoning bylaws, fire regulations and such ordinances as access for the handicapped.

The architect may assist in getting construction bids, selecting a contractor and negotiating contracts. S(he) may be engaged to ensure contractors follow the design, use specified materials and meet quality standards. The job is not completed until all construction is finished, required tests performed and construction costs paid.

Architects design a variety of buildings—offices, apartments, schools, churches, factories, hospitals, houses and airports—as well as such multi-building complexes as urban centers, college campuses, industrial parks and entire communities. In addition to design, architects may advise on site selection, cost and land-use studies and long-range land development.

Some specialize in one type of building, in construction management or in managing their own firm, doing little design work. They often work with engineers, urban planners, interior designers and landscape architects.

### **Landscape Architects**

The *Handbook* notes that landscape architects design residential areas, parks, campuses, shopping centers, golf courses, parkways and industrial parks to be functional, beautiful, and compatible with their setting. They plan building locations, roads and walkways, arrangements of flowers, shrubs and trees. They redesign streets to limit car traffic and improve pedestrian access and safety. They also work on natural resource conservation and historical preservation.

Landscape architects may be hired by organizations like real estate developers starting new projects and municipalities constructing airports or parks. Often they are involved from project conception and work with architects and engineers determining the best arrangement of roads and buildings. They develop plans indicating new topology, vegetation, walkways and landscape amenities.

Landscape architects discuss with clients the purpose of the project and funds available. They analyze site elements such as climate, soil, slope, drainage and vegetation. They observe the fall of sunlight and access to existing buildings, roads, walkways and utilities. Then they prepare preliminary plans which are subject to

change. Many now use Computer Aided Design and Drafting (CADD) and video simulators to help clients access proposals.

Working with other professionals in the design phase, once the design is complete, landscape architects draw up detailed plans, including written reports, sketches, models, photographs, land-use studies and cost estimates. Once the plan is approved, they prepare working drawings showing existing and proposed features, outline methods of construction and materials required. Many supervise installation of their design. Some are involved in construction, but this is generally done by a contractor or developer.

Some landscape architects work on a variety of projects, while others specialize in residential, historical, restoration, water improvements, parks, playgrounds or shopping centers. Others work in regional planning and resource development, feasibility, environmental impact and cost studies, or site construction. Yet others teach at the college or university level.

### **Membership**

While Census data does not distinguish between types of architects, two data sets provide a more detailed view of the profession: the American Institute of Architects (AIA) and the American Society of Landscape Architects (ASLA).

If one accepts the 1990 Census count of 157,759 architects in the experienced civilian labor force and, further, that membership in the AIA and ASLA is mutually exclusive (which is not necessarily true), then the 56,802 AIA members represented 36.0 percent of all architects and the 10,443 ASLA members, 6.6 percent. The remaining 90,514 or 57.4 percent of Census architects were not affiliated with either organization.

### **Age**

Data concerning the age distribution of architects is available only from the Census of Population. Accordingly, all architects are reported, including landscape architects. (Exhibit 1)

Between 1970 and 1990 architects of all ages increased at an average rate of 60.1 percent each decade from 56,125 in 1970 to 157,759 in 1990.

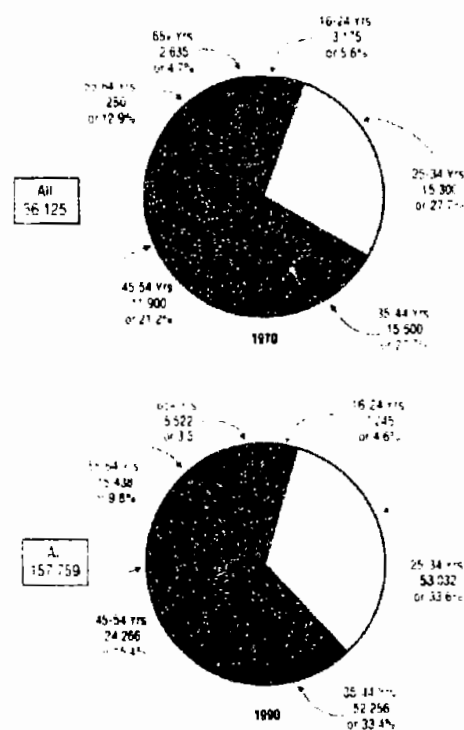

Architects aged 16 to 24 increased at an average rate of 29.6 percent each decade from 3,175 in 1970 to 7,245 in 1990.

Architects aged 25 to 34 years increased between 1970 and 1990 at an average rate of 62.3 percent each decade from 15,300 in 1970 to 53,032 in 1990. As a percent of all architects, they increased from 27.7 percent in 1970 to 33.6 percent in 1990.

Between 1970 and 1990 architects from 35 and 44 years increased at an average rate of 92.6 percent each decade from 15,500 in 1970 to 52,256 in 1990. As a percent of all architects they grew from 27.7 percent in 1970 to 33.1 percent in 1990.

Those aged between 45 and 54 years increased between 1970 and 1990 at an average rate of 40.6 percent each decade from 11,900 in 1970 to 24,266 in 1990. As

Exhibit 1  
Percentage Distribution of Census Architects  
by Age Category 1970 & 1990

a percent of all architects they decreased from 21.2 percent in 1970 to 15.4 percent in 1990.

Architects from 55 to 64 years increased at an average rate 44.0 percent each decade from 7,250 in 1970 to 15,438 in 1990. They decreased from 12.9 percent in 1970 to 9.8 percent in 1990 as a percent of all architects.

Those over 65 years increased between 1970 and 1990 an average rate of 47.0 percent each decade from 2,625 in 1970 to 5,522 in 1990. As a percent of all architects they went from 4.7 percent in 1970 to 3.5 percent in 1990.

### Ethnicity and Race

Data concerning ethnicity and race of architects are presented from the 1970, 1980 and 1990 Census of Population. It reports all architects (Exhibit 2). Data are also presented for members of the American Institute for Architecture. The two data sets are not directly comparable.

Between 1970 and 1990 Hispanic architects increased at an average rate of 124 percent each decade from 938 in 1970 to 8,006 in 1990. This was significantly faster than growth of Hispanics in the general labor force (74 percent per decade), faster than growth of Hispanics among professional specialty workers (97.6 percent per decade), and faster than growth in Hispanics among artists in general (113.6 percent

Exhibit 2  
Percentage Distribution of Census Architects by  
Selected Racial Categories: 1970, 1980 & 1990

per decade). As a percent of all architects, they increased from 1.8 percent in 1970 to 5.1 percent in 1990. The number of non-Hispanic architects decreased from 98.8 percent of all architects in 1990 to 94.9 percent in 1990.

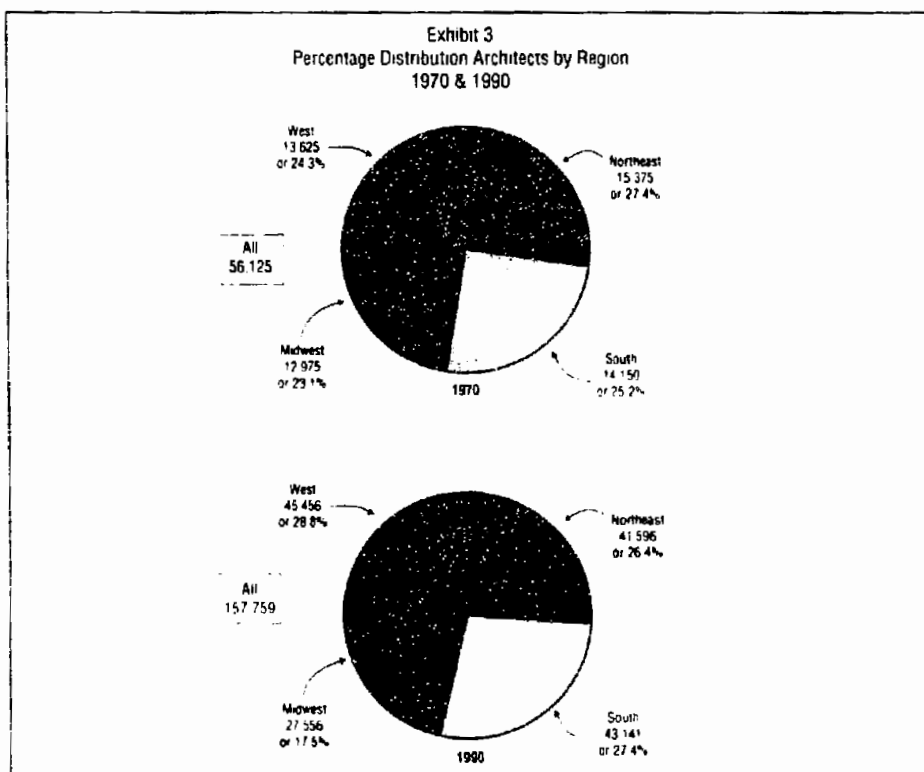

Black or Afro-American architects increased at an average rate of 70.5 percent each decade from 1,273 in 1970 to 4,429 in 1990. This was faster than growth of whites (59.1 percent per decade), but significantly slower than growth among architects of other races, for example Asians (118.7 percent). Black architects did, however, increase in numbers faster than blacks in the general labor force (an average rate of 26.6 percent per decade), faster than blacks among professional specialty workers (at an average rate of 55.2 percent per decade), but slower than blacks among

artists in general (at an average rate of 72.3 percent per decade). As a percent of all architects, blacks increased from 2.4 percent in 1970 to 2.8 percent in 1990.

If one compares 1990 Census data with reported 1989 members of the American Institute of Architects, Census Hispanic architects were 5.1 percent of all architects compared with 2.9 percent of AIA members. Census blacks represented 2.8 percent of all architects compared to 1.7 percent of AIA members. Whites represented 90.5 percent of all Census architects compared to 89.4 percent of AIA members.

### Residence

Data concerning the residence of architects is available from the Census of Population and the two representative architectural associations. It is presented here for the four principal Census regions: the Northeast, South, Midwest and West (Exhibit 3).

Between 1970 and 1990 architects living in the Northeast increased at an average rate of 69.6 percent each decade from 15,375 in 1970 to 41,596 in 1990. As a percent of all architects, they decreased from 27.4 percent in 1970 to 26.4 percent in 1990. They were 26.4 percent of all architects in 1990.

Architects living in the South increased at an average rate of 60.3 percent each decade from 14,150 in 1970 to 43,141 in 1990. They were 27.4 percent of all architects in 1990.

Midwestern architects increased at an average rate of 41 percent each decade from 12,975 in 1970 to 27,566 in 1990. They were 17.5 percent of all architects in 1990.

Western architects increased at an average rate of 36.5 percent each decade from 13,625 in 1970 to 45,456 in 1990. They represented 28.8 percent of all architects in 1990.

A comparison of the 1990 Census regional distribution with the 1990 membership in the American Institute of Architects and the 1991 membership in the American Society for Landscape Architects shows that:

- the Northeast accounted for 26.4 percent of Census architects, 21.5 percent of AIA members and 21.4 percent of ASLA members.
- the South accounted for 27.4 percent of Census architects, 31.8 percent of AIA members and 34.7 percent of ASLA members.
- the Midwest accounted for 17.5 percent of Census architects, 19.9 percent of AIA members and 17.4 percent of ASLA members, and
- the West accounted for 28.8 percent of Census architects, 26.4 percent of AIA members and 26.5 percent of ASLA members.

## Gender

Data concerning the gender of architects is available from the Census of Population and from reporting members of the AIA.

Between 1970 and 1990 female architects increased on an average rate of 180.1 percent per decade from 2,075 in 1970 to 23,723 in 1990. This compares with an average rate growth among women in the ECLF of 24.5 percent, of 41.1 percent among PSW and 86.9 percent among all artists. As a percentage of all architects, women went from 3.7 percent in 1970 to 17.7 percent in 1990.

Comparing the 1990 Census with the reported 1989 AIA members shows women were 17.7 percent of Census architects and 9.2 percent of AIA members.

## Education and Licensing Requirements

According to the *Occupational Handbook*, all states and the District of Columbia require licensing before calling oneself an architect or contracting to provide architectural services. While many architectural school graduates work in the field without being licensed, a licensed architect is legally responsible for all work. Licensing usually requires a professional architectural degree, a period of practical training or internship (usually three years) and passing the Architect Registration Examination.

In most states the professional degree is from one of 96 architectural schools accredited by the National Architectural Accrediting Board. There are several types of degree. Over half of all architects have a five-year Bachelor of Architecture. There is a two-year Master's with a pre-professional degree in architecture or a selected area and three- or four-year Master's for those with a degree in another discipline. Many combinations and variations of these programs also exist.

A typical five-year Bachelor program includes architectural history and theory, building design including technical and legal requirements, math, physical sciences and liberal arts. Many schools also offer graduate programs beyond a professional degree for research, teaching and certain specialties.

With respect to landscape architects, the *Handbook* notes that a Bachelor's or Master's degree in landscape architecture is usually required. The Bachelor's program is usually four to five years. Of the two types of Master's degrees, a three-year program is for those with a Bachelor's degree in another discipline (most common), and a two-year program is for those with a Bachelor's in landscape architecture.

In 1990, 51 colleges and universities offered 61 undergrad and grad programs accredited by the American Society for Landscape Architecture. Typically, courses include surveying, landscape design and construction, ecology, structural design, city and regional planning, history of landscape architecture, plant and soil science, geology, design and color theory and general management. The design studio is an important aspect of the curriculum. Students are assigned real projects providing hands-on experience. Prerequisites often include English, math and social science.

Some 44 states require licensing based on the Uniform National Examination (UNE), admission to which usually requires a degree from an accredited school plus one to four years work experience. Some states require an additional exam on law and plants indigenous to that state. The federal government does not require a license.

In states requiring licenses, entrants are called interns until licensed. They may do research, prepare base maps or participate in actual design work, supervised by a licensed landscape architect who takes legal responsibility. After several years beyond receiving their license, they may become associates or partners, or open their own offices.

## Attainment

Data concerning the educational attainment of architects is available from the Census of Population, the Department of Education and the American Society for Landscape Architects.

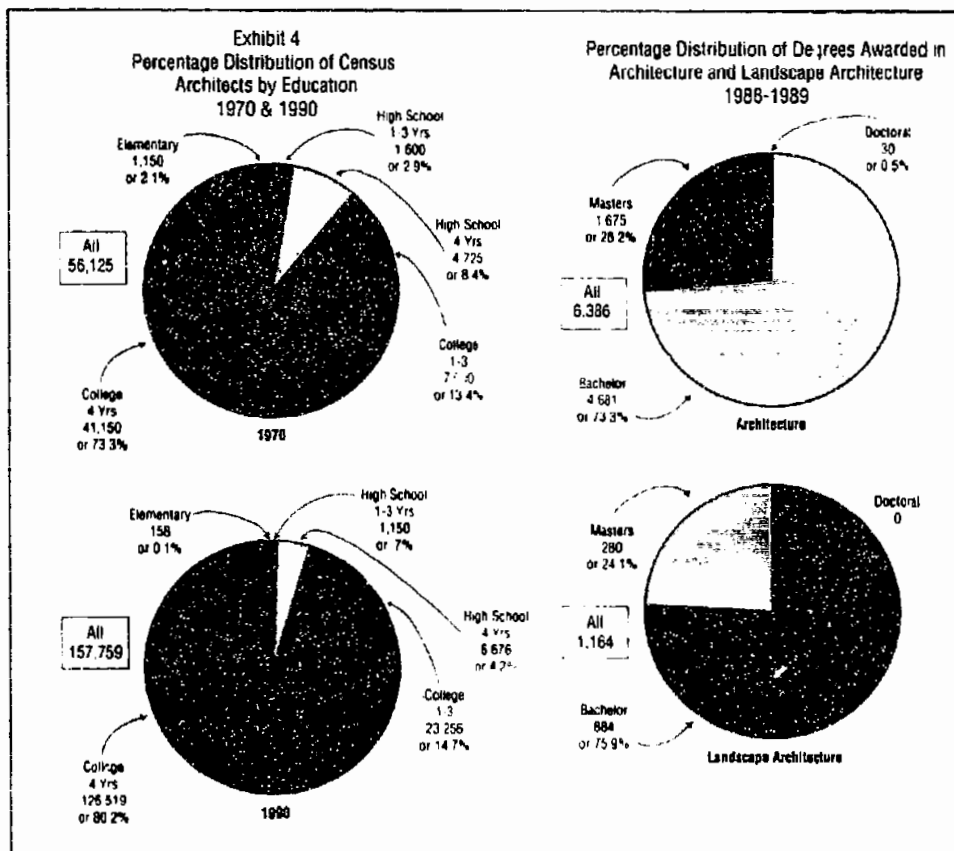

Architects with only elementary education declined at an average rate of -56.1 percent each decade from 1,150 in 1970 to 158 in 1990. As a percent of all architects they decreased from 2.1 percent in 1970 to 0.1 percent in 1990. (Exhibit 4)

Architects with one and three years of high school education decreased at an average rate of -8.6 percent each decade from 1,600 in 1970 to 1,150 in 1990. Compared to all architects, they declined from 2.9 percent in 1970 to 0.7 in 1990.

Between 1970 and 1990 architects with four years of high school increased at an average rate of 13.1 percent each decade from 4,725 in 1970 to 6,676 in 1990. As a percent of all architects, they decreased from 8.4 percent in 1970 to 4.2 percent in 1990.

Architects with one to three years of college or university education increased between 1970 and 1990 at an average rate of 68.8 percent each decade from 7,500 in 1970 to 23,256 in 1990. Compared to all architects, they increased from 13.4 percent in 1970 to 14.7 percent in 1990.

Architects with four years or more of college or university education increased at

an average rate of 68.4 percent each decade from 41,150 in 1970 to 126,519 in 1990. As a percent of all architects, they increased from 73.3 percent in 1970 to 80.2 percent in 1990.

### Degrees and Enrollment

Using Department of Education data, in 1988-89 there were 6,386 college or university degrees awarded in architecture at the Bachelor level (73.3 percent of degrees), Master's (26.2 percent) and Doctoral (0.5 percent). There were 1,164 degrees in landscape architecture awarded at the Bachelor level (75.9 percent) and at the Master's level (24.1 percent). Data from the American Society for Landscape Architecture indicate an increasing professionalism in the field. In 1971 there were 22 accredited programs in landscape architecture of which 18.2 percent were at the Master's level. By 1991 there were 64 accredited programs of which 36.1 percent were at the Master's level. Female students in accredited programs in 1990-91 represented almost 31 percent of all students, compared to 15 percent of 1990 Census architects.

## Employment

Data concerning the employment of architects are available from the Census of Population, Census of Service Industries and from two representative associations. Census data do not distinguish landscape architects from architects in general.

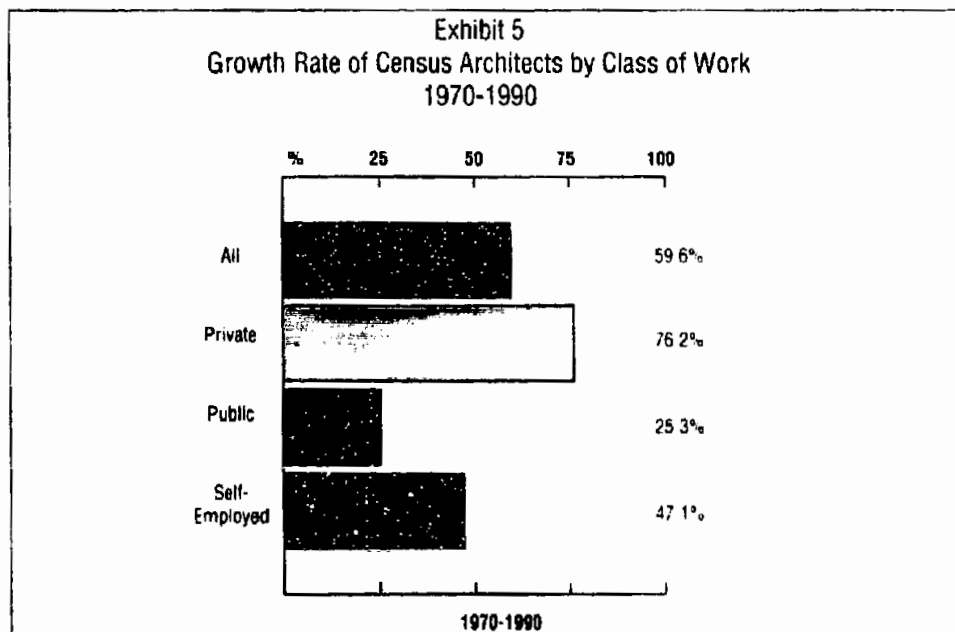

Architects employed in the private sector increased at an average rate of 76.2 percent each decade from 28,225 in 1970 to 92,029 in 1990. As a percent of all architects, they increased from 49.3 percent in 1970 to 59.8 percent in 1990. (See Exhibit 5.)

Between 1970 and 1990 architects employed in the public sector increased at an average rate of 25.3 percent from 6,775 in 1970 to 11,208 in 1990. As a percent of architects, they decreased from 12.2 percent in 1970 to 7.3 percent in 1990.

Self-employed architects increased at an average rate of 47.1 percent each decade from 20,375 in 1970 to 50,535 in 1990. As a percent of all architects, they decreased from 36.7 percent in 1970 to 32.8 percent in 1990.

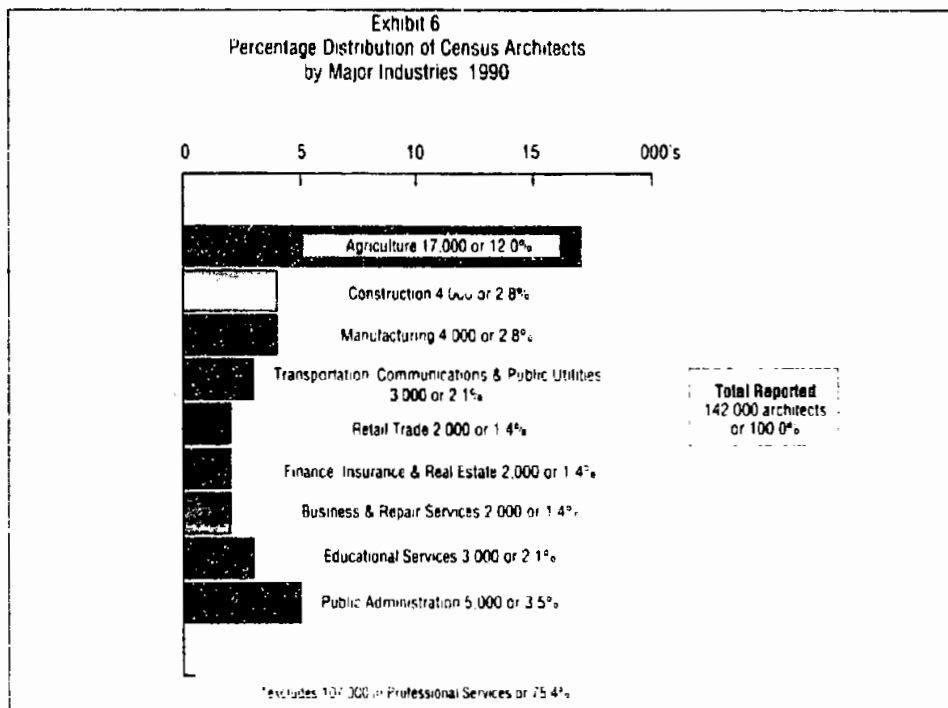

The unemployment rate for architects was 1.2 percent in 1970 and 2.4 percent in 1990. This compares with experienced civilian labor force unemployment of 4.1 percent in 1970 and 5.5 percent in 1990. For professional special workers the corresponding rates were 1.8 percent unemployed in 1970 and 2.1 percent in 1990. For all artists, the corresponding rates were 4.5 percent in 1970 and 4.8 percent in 1990.

The 1980 and 1990 Census shows that full-time architects increased as a percentage of all architects from 70.7 percent in 1980 to 73.2 percent in 1990. Accordingly, more than a quarter of all architects work only part-time. Female architects accounted for 11.8 percent of full-time architects in 1990, but 25.7 percent of part-time architects.

## By Industry

While over 75 percent of Census architects in 1990 were employed in the professional service industries (mainly architectural, engineering and surveying firms), architects were also employed elsewhere. Of the other industries reporting architects, 12 percent were in agriculture, 3.5 percent in public administration, 2.8 percent in both construction and manufacturing, 2.1 percent in transportation, communications and public utilities, 2.1 percent in educational services, 1.4 percent in retail trade, finance, insurance, real estate and business and repair services industries (Exhibit 6).

The Census of Service industries provides a breakout of architects from landscape architects. In 1987, within the broad category called Construction, Finance and Service Industries, 62,520 architects were employed, representing 0.5 percent of employment in industries reporting these occupations. Of these, 85 percent were general architects working in miscellaneous service industries; 8.4 percent were landscape architects employed in miscellaneous service industries; 4 percent were general architects employed in the construction industries and 2.7 percent were general architects in business services industries.

## Establishments

Architectural services are provided by three types of businesses: architectural, engineering and surveying service establishments. In 1982 engineering establishments employed 5,218 architects (compared to 31,871 by architectural

firms), while in 1987 surveying establishments employed 158 architects (compared to 40,583 by architectural service firms). For purposes of this analysis, no further reference will be made to engineering or surveying service establishments.

The number of architectural services firms increased from 13,414 in 1982 to 17,777 in 1987. Total receipts increased from \$5.9 to \$9.9 billion. Paid employees increased from 105,270 to 136,809, while architects as a percent of total employment declined from 30.3 percent to 29.7 percent. The number of sole proprietors increased from 8,039 in 1982 to 8,950 in 1987. Compared to all establishments, sole proprietorships declined from 59.9 percent in 1982 to 50.4 percent in 1987.

Regarding the distribution of architectural establishments, staff and fees by project type, source and client for 1982 and 1987, in-house projects generated \$5.1 billion in 1982 and \$8.6 billion in 1987. Of total in-house work, commercial buildings accounted for more than 40 percent, while public and institutional facilities accounted for more than 25 percent in each year. All other types of projects accounted for less than 10 percent of revenues.

As to the source of receipts including work done outside of architectural firms, on average for both years: architectural services, excluding landscape architecture, produced more than 75 percent of revenues; work done outside, but reimbursable, more than 10 percent; consulting and design engineering more than 6 percent and all other activities accounted for the balance.

Regarding fees from clients, on average: industrial, business and commercial clients paid more than 33 percent; government more than 23 percent; private institutions more than 17 percent; private individuals more than 8 percent and all other clients, less than 19 percent.

Regionally, the Northeast accounted for 21.9 percent of all establishments in 1987 and 24.1 percent of all receipts; the South for 32.1 percent of the firms and 29.4 percent of receipts; the Midwest for 18.1 percent of firms and receipts and the West for 28.7 percent of firms and 28.4 percent of receipts.

By contrast, firms in the Northeast belonging to the American Institute for Architecture accounted for 23 percent of all AIA firms; the South for 32 percent; the Midwest for 15 percent and the West for 30 percent.

## Income

Data about the income of architects are available from the Census of Population and two representative associations. Census data due to definition changes are presented only for 1980 and 1990, so no meaningful growth rate analysis is possible.

In 1990 architects working full-time and earning \$7,500 or less accounted for 1.9 percent of all architects; those earning \$7,500 to \$14,999 in the year before the Census, 3.3 percent; \$15,000 to \$24,999, 13.6 percent; \$25,000 to \$34,999, 23.4 percent; \$35,000 to \$49,999, 29.4 percent; \$50,000 to \$69,999, 16.2 percent; \$70,000 to \$99,999, 6.2 percent and those earning more than \$100,000, 6 percent (Exhibit 7).

Median income for full-time male architects was \$40,110 and for females, \$29,451 or 73.4 percent of males. Median full-time earnings of male architects were 141 percent of the median full time earnings of males in the experienced civilian labor force; equal to earnings of male professional specialty workers and 129 percent of artists' median full-time earnings.

Architects living in households with an annual income under \$15,000 in the year before the Census accounted for 3.4 percent of all architects; those earning \$15,000 to \$24,999, 5.9 percent; \$25,000 to \$34,999, 11.4 percent; \$35,000 to \$49,999, 20.4 percent; \$50,000 to \$64,999, 19.2 percent; \$65,000 to \$94,999, 23.4 percent; \$95,000 to \$124,999, 8.2 percent and those earning more than \$125,000 the year before the Census, 8 percent.

The median household income for male architects was \$56,952 and for females, \$55,639 or 97.7 percent of males. The median household income with either a male or female architect was \$56,773. Median household income of all architects was 140 percent that of the experienced civilian labor force, 109 percent of professional specialty workers and 128 percent of artists.

Exhibit 8 shows the median annual compensation of AIA members by position in 1990.

Members of the American Society for Landscape Architects working in the private sector in 1991 had an annual median income, from all sources, of \$43,575.

Those working in the public sector earned \$41,475, while those in academic positions earned \$49,350.

## Designers

To provide a basic understanding of design occupations, descriptions derived from the *Occupational Handbook 1992-93* (Bureau of Labor Statistics, 1993) are given here.

Designers organize and design articles, products and materials to serve a purpose and to be visually pleasing. Pleasant surroundings, beautiful clothes and floral arrangements boost our spirits, while eye-catching products and packaging are more likely to attract buyers. Designers usually specialize, for example on cars, furniture, home appliances, industrial equipment, movie and theater sets, packaging, flower arrangements, etc.

In developing a design they first determine the needs of the client and potential users. They consider size, shape, weight, color, materials and the way a product functions, as well as maintenance, safety and cost. They take into account—and often set—style and fashion trends. They usually sketch several possible designs which are present for final selection to an art or design director, a product

development team, a play, film or television director, or a client.

The designer then makes a model, sample or detailed plan drawn to scale. Increasingly, Computer Aided Design and Drafting (CADD) is used, while industrial designers use Computer Aided Industrial Design (CAID) to create a design and communicate it to automated production tools.

Designers may supervise craft workers who carry out the design. Owners may devote much time to developing business contacts and to administrative tasks like reviewing catalogs and samples.

Design is not one but a number of fields including:

- **Industrial Designers** develop and design manufactured products like appliances, cars, computers, medical, office and recreation equipment and children's toys. They combine artistic talent with market research on product use, marketing, materials and production methods to create the most functional and appealing design and make products competitive in the marketplace.
- **Interior Designers** plan space and furnish interiors of homes, hotels, offices, public buildings, restaurants, stores and theaters. With a client's tastes and needs in mind they prepare working drawings and specifications for interior construction, furnishings, lighting and finishes including crown moldings, coordinating colors and selecting furnishings, floor and window coverings. They also plan additions and renovations. They must design in accordance with federal, state and local building codes.
- **Set Designers** study scripts, confer with directors and conduct research to determine appropriate styles and then design sets for film, television and theater.
- **Fashion Designers** design wearing apparel and accessories. Some high-fashion designers are self-employed and design for individual clients. They make fashion by establishing the "line" and colors. Some cater to specialty stores or high-fashion department stores. They design original garments, as well as follow established trends. Most work for apparel manufacturers and adapt clothing to the mass market.
- **Textile Designers** design fabrics for garments, upholstery, rugs and other products using their knowledge of materials and fashion trends.
- **Floral Designers** cut and arrange fresh, dried or artificial flowers and foliage into designs expressing the sentiments of the sender. Duties depend on the size of the shop and the number of designers.

## Membership

While Census data does not distinguish between types of decorators and designers, it does identify 98 distinct occupations. Two data sets provide a more detailed view of the profession. The first is from the Industrial Designers Society of America (IDSA). The second is from the American Institute of Graphic Arts. Summary findings on data from all federal sources and from the two representative associations are given below.

## Age

Data concerning the age distribution of decorators and designers is available only from the Census of Population and only for combined decorators and designers. The combined group of all ages increased between 1970 and 1990 at an average rate of 78.9 percent each decade from 185,954 in 1970 to 600,810 in 1990.

The combined group aged 16 to 24 years increased at an average rate of 42.3 percent each decade from 28,765 in 1970 to 65,526 in 1990. As a percent of all combined decorators and designers, they declined from 15.5 percent in 1970 to 10.9 percent in 1990 (Exhibit 9).

Decorators and designers aged 25 to 34 years increased at an average rate of 91.9 percent each decade from 48,478 in 1970 to 200,628 in 1990. As a percent of combined decorators and designers they increased from 26.1 percent in 1970 to 33.4 percent in 1990.

Combined decorators and designers aged 35 to 44 years increased at an average rate of 112.2 percent each decade from 42,900 in 1970 to 169,075 in 1990. As a percent of all the combined group they increased from 23.1 in 1970 to 28.1 in 1990.

Between 1970 and 1990 decorators and designers aged 45 to 54 increased at an average rate of 71.4 percent each decade from 36,468 in 1970 to 97,821 in 1990. As

a percent of all decorators and designers they decreased from 19.6 percent in 1970 to 16.3 percent in 1990.

The group of decorators and designers aged 55 to 64 years increased at an average rate of 34.5 percent each decade from 29,039 in 1970 to 50,388 in 1990. As a percent of all decorators and designers, they decreased from 15.6 percent in 1970 to 8.4 percent in 1990.

The group 65 years and older increased at an average rate of 54.6 percent each decade from 7,354 in 1970 to 17,372 in 1990. As a percent of all decorators and designers, they decreased from 4 percent in 1970 to 2.9 percent in 1990.

### **Ethnicity and Race**

Data concerning ethnicity and race of combined decorators and designers is presented from the 1970, 1980 and 1990 Census of Population.

Between 1970 and 1990 Hispanic decorators and designers grew at an average rate of 130 percent each decade from 6,815 in 1970 to 32,296 in 1990. This was significantly faster than growth of Hispanics in the general labor force (an average rate of 74 percent per decade), faster than growth of Hispanics among professional specialty workers (an average rate of 97.6 percent per decade) and faster than growth in Hispanics among artists in general (an average rate of 113.6 per decade). As a percent of all decorators and designers, they increased from 2.9 percent in 1970 to 5.3 percent in 1990.

Between 1970 and 1990 black or Afro-American decorators and designers increased at an average rate of 106.5 percent each decade from 4,445 in 1970 to 21,204 in 1990. This was faster than growth of whites (an average rate of 59.7 percent per decade), but significantly slower than growth of decorators and designers of other races (an average rate of 180.5 percent). Black decorators and designers did, however, increase faster than blacks in the general labor force (an average rate of 26.6 percent per decade), faster than blacks among professional specialty workers (an average rate of 55.2 percent per decade) and faster than blacks among all artists (an average rate of 72.3 percent per decade). As a percent of all decorators and designers, blacks went from 1.9 percent in 1970 to 3.6 percent in 1990. Whites declined from 96 percent in 1970 to 90.2 in 1990. Other races increased from 2.1 percent in 1970 to 6.2 percent in 1990 (Exhibit 10).

### **Residence**

Data concerning the residence of decorators and designers came from the Census of Population, the Industrial Designers Society of America and the American Institute of Graphic Arts. It is presented for the Northeast, South, Midwest and West (Exhibit 11).

Designers and decorators living in the Northeast increased at an average rate of 44.8 percent each decade from 75,766 in 1970 to 149,888 in 1990. Compared to all designers, they decreased from 32.5 percent in 1970 to 25 percent in 1990.

Exhibit 10  
Percentage Distribution of Census Combined  
Decorators & Designers by Selected  
Racial Category, 1970, 1980 & 1990.

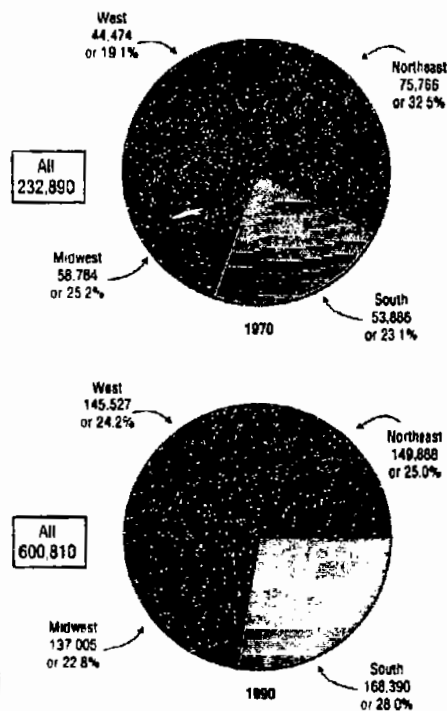

Exhibit 11  
Percentage Distribution of Census Combined  
Decorators & Designers by Region  
1970 & 1990

Those living in the South increased at an average rate of 78.5 percent each decade from 53,886 in 1970 to 168,390 in 1990. Compared to all designers, they grew from 23.1 percent in 1970 to 28 percent in 1990.

Midwestern designers and decorators increased at an average rate of 58.5 percent from 58,764 in 1970 to 137,005 in 1990. As a percent of the total, they decreased from 25.2 percent in 1970 to 22.8 percent in 1990.

Designers and decorators in the West increased at an average rate of 86.9 percent

each decade from 44,474 in 1970 to 145,527 in 1990. As a percent of all designers, they increased from 19.1 percent in 1970 to 24.2 percent in 1990.

By comparison, for 1987 members of the American Institute for Graphic Arts: Northeast, 42 percent; South, 17 percent; Midwest, 17 percent and West 22 percent. And for members of the Industrial Designers Society of America: Northeast, 29.7 percent; South 16 percent; Midwest 31.9 percent and West, 22.4 percent.

## Gender

Data concerning gender is available from the Census of Population and reporting members of the American Institute of Graphic Arts.

Between 1970 and 1990 female decorators and designers increased at an average rate of 106.4 percent per decade from 71,262 in 1970 to 333,032 in 1990. This compares with an average rate growth per decade of women among the experienced civilian labor force of 24.5 percent; among professional specialty workers, 41.1 percent and among all artists, 86.9 percent. As a percentage of all decorators and designers, women increased from 38.3 percent in 1970 to 55.4 percent in 1990.

Female decorators increased at an average rate of 100 percent per decade from 30,717 in 1970 to 176,500 in 1990. As a percentage of all decorators, women increased from 58.5 percent in 1970 to 73.3 percent in 1990.

Female designers also increased from 1970 to 1990, growing at an average rate of 116 percent per decade from 27,975 in 1970 to 156,500 in 1990. As a percentage of all designers women went from 25 percent in 1970 to 43.5 percent in 1990.

By contrast, in 1987, 46 percent of reporting members of the American Institute for Graphic Arts were women.

## Education Requirements

According to the *Occupational Handbook* (Bureau of Labor Statistics, 1993), creativity is crucial for designers and decorators, together with a strong color sense, an eye for detail, balance and proportion and sensitivity to beauty. Sketching is especially important for fashion design. Some formal preparation in design is important in all but floral design.

Educational requirements for entry vary. Industrial design requires a Bachelor's degree, interior design a four-year Bachelor's in fine art. Interior designers must also be familiar with federal, state and local building codes, as well as toxicity and flammability standards. In fashion design some formal education, such as a two-to four-year degree is important, plus knowledge of textiles, fabrics, ornamentation and fashion trends. Floral designers usually need only a high school degree as most learn on the job.

Formal training in some design disciplines is available from professional schools offering certificates or associate degrees. Four-year college and university programs grant a Bachelor of Fine Arts. The curriculum includes art and art history, principles

of design, designing and sketching. Also, specialized programs like garment construction, textiles, mechanical and architectural drawing, computerized design, sculpture, architecture, marketing and basic engineering. Persons with architectural training also qualify for some design occupations, especially interior design. Computer aided design is taught, especially in industrial design.

In 1991, the National Association of Schools of Art and Design accredited 166 post-secondary institutions in art and design. Most award a degree in art, some in industrial, interior, textile, graphic or fashion design. Many allow entry into a Bachelor's program only after a year of basic art and design courses.

The Foundation for Interior Design Education Research accredits interior design programs and schools. There are 89 accredited programs in the U.S. and Canada located in schools of art, architecture and home economics. Some colleges and universities offer degrees in floriculture and floristry and provide training in flower marketing and shop management. Floral design is also taught in private schools.

Interior design is the only design discipline subject to government regulation. The District of Columbia licenses and 14 states regulate use of the title. Membership in a professional association is a mark of achievement, usually requiring completion of three or four years of post-secondary education in the field, at least two years of practical experience and completion of the National Council for Interior Design Qualification Examination.

### **Educational Attainment**

Data concerning the educational attainment of decorators and designers is available from the Census of Population (for combined decorators and designers), from the Department of Education and from the American Institute of Graphic Arts.

Decorators and designers with only elementary education declined from 10,823 in 1970 to 9,745 in 1990. Compared to all decorators and designers, they decreased from 5.8 percent in 1970 to 1.6 percent in 1990 (Exhibit 12).

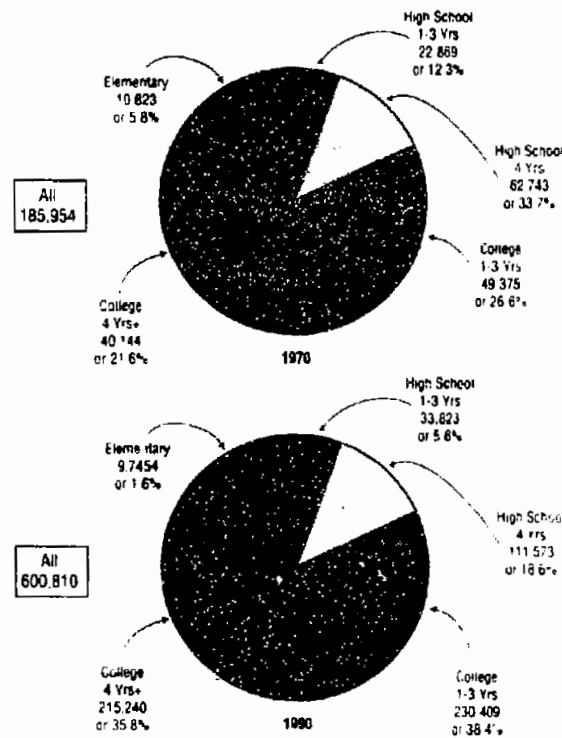

Those decorators and designers with one to three years of high school increased at an average rate of 23.8 percent each decade from 22,869 in 1970 to 33,823 in 1990. Compared to all decorators and designers, however, they decreased from 12.3 percent in 1970 to 5.6 percent in 1990.

Those with four years of high school increased at an average rate of 29.8 percent per decade from 62,743 in 1970 to 111,573 in 1990. They decreased, however, compared to all in the field from 33.7 percent in 1970 to 18.6 in 1990.

Decorators and designers with one to three years of college or university increased at an average rate of 120.5 percent each decade from 49,375 in 1970 to 230,409 in 1990. Compared to all in the field they increased from 26.6 percent in 1970 to 38.4 percent in 1990.

Those with four or more years of college or university education increased at an average rate of 117.2 percent each decade from 40,144 in 1970 to 215,240 in 1990. Compared to all decorators and designers they increased from 21.6 percent in 1970 to 35.8 percent in 1990.

Exhibit 12  
Percentage Distribution of Census Combined Decorators &  
Designers by Education, 1970 & 1990.

### Degrees and Enrollment

Department of Education data shows that 5,354 college or university degrees were awarded in 1988-89 in design at the Bachelor level (93.3 percent) and Master's level (6.7 percent).

In 1987 there were 174 graduate design programs offered by American colleges and universities of which 35.1 percent were in graphic design, 13.2 percent in industrial design, 28.8 percent in interior design and 23 percent in textile design. At both the Bachelor and Master level, percentages of students enrolled and graduated were highest in graphic design. Interior design, industrial design and communications design were the other three areas largest in enrollment and degrees awarded.

By contrast with 1990 Census figures, of reporting members of the American Institute for Graphic Arts, 13 percent had roughly three years of college or university compared to 38.4 percent for all decorators and designers. And 87 percent had four years or more of college or university education compared to 35.8 percent for all decorators and designers.

## Employment

Data concerning the employment of decorators and designers is available from the Census of Population, the Census of Service Industries and from representative associations.

Decorators and designers employed in the private sector increased at an average rate of 69.9 percent each decade from 144,554 in 1970 to 416,352 in 1990. As a percent of all decorators and designers, they decreased from 80.4 percent in 1970 to 72.1 percent in 1990.

Those employed in the public sector increased at an average rate of 68.4 percent each decade from 5,105 in 1970 to 15,046 in 1990. Compared to all in the field, they declined from 2.8 percent in 1970 to 2.6 percent in 1990.

Self-employed decorators and designers increased at an average rate of 115.1 each decade from 28,586 in 1970 to 142,178 in 1990. As a percent of the field, they increased from 15.9 percent in 1970 to 24.6 percent in 1990.

The unemployment rate for combined decorators and designers was 3.3 percent in 1970 and 3.9 percent in 1990. This compares with the experienced civilian labor force rate of unemployment of 4.1 percent in 1970 and 5.5 percent in 1990. For professional speciality workers the corresponding rates were 1.8 percent in 1970 and 2.1 percent in 1990. For all artists the corresponding rates were 4.5 percent in 1970 and 4.8 percent in 1990.

Data for full- and part-time decorators and designers are from the 1980 and 1990 Census. Drawing upon work by Ellis and Beresford (1994), full-time decorators and designers increased compared to all decorators and designers from 53.8 percent in 1980 to 54.4 percent in 1990. Accordingly, nearly half of all decorators and designers worked only part-time. Female decorators and designers accounted for 45.5 percent of full-time workers in 1990, but 72 percent of part-time.

## By Industry

Exhibit 13 presents the distribution of Census combined decorators and designers by major industries in 1990. Over 80 percent were employed in retail trade (29.4 percent), business and repair industries (26.4 percent) and manufacturing industries (24.9 percent). Other professional services industries employed 7.7 percent. There were 2.6 percent in wholesale trade; 2.1 percent in transportation, communications and public utilities; 1.5 percent in construction, entertainment and recreation; 1.3 percent in educational services and less than 1 percent in finance, insurance, real estate, public administration, agricultural industries, personal services industries and health services. Decorators and designers represented 0.5 percent of total employment in industries reporting these occupations.

In 1987 the broad Census category called Construction, Finance and Service industries accounted for 61,130 employed decorators and designers, including 48,040 designers (excluding interior designers) and 15,090 interior designers. In total, they represented 0.5 percent of total employment in industries reporting these

Exhibit 13  
Percentage Distribution of Census Combined Decorators &  
Designers by Major Industries, 1990.

occupations. Of these 65.6 percent worked in business services industries; 29.3 percent in miscellaneous service industries; 4.1 percent in construction; 2.1 percent in amusement and recreation services; 1.6 percent in motion pictures and 0.6 percent in museums, botanical and zoological parks.

In the broad category called Non-Manufacturing Industries in 1988 there were 244,020 decorators and designers made up of 140,770 designers (excluding interior designers), 43,580 interior designers and 59,670 merchandise displayers and window trimmers representing 0.5 percent of total employment in industries reporting these occupations. Of these 43.9 percent were in retail trade; 11.7 percent in wholesale trade; 3.4 percent in electric, gas and sanitary services and 0.2 percent in communications.

In the broad category called Manufacturing Industries in 1989 there were 39,890 made up of designers (excluding interior designers), representing 0.5 percent of total employment of the industries reporting these occupations. Of these 15.2 percent were in apparel and other textile products; 12.7 percent in printing and publishing; 12.1 percent in transportation equipment; 10.8 percent in industrial machinery and equipment; 10.3 percent in miscellaneous industries and fewer than 10 percent in all other reporting industries.

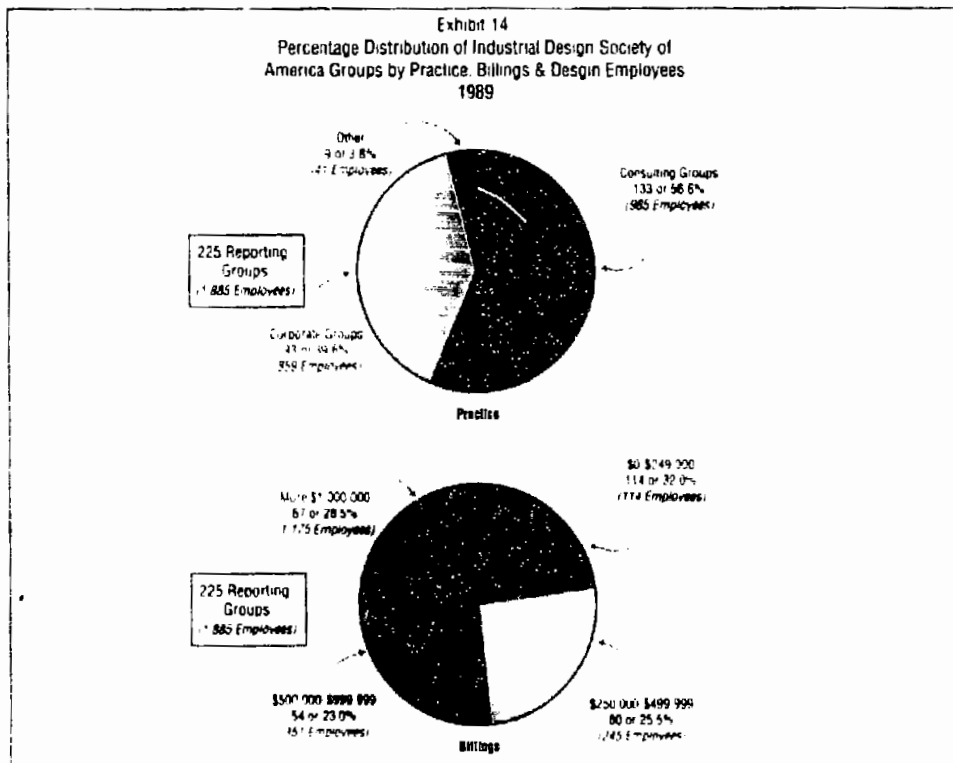

## Establishments

The Census of Service Industries offers insight into the establishments providing graphic arts services. Two types of businesses provide these services: commercial art and graphic design firms and graphic design firms. For purposes of this analysis, no further reference will be made to commercial art and graphic design firms.

In 1987 there were 7,202 graphic design establishments with receipts of \$3.2 billion. The Northeast accounted for 30 percent of establishments and 34.3 percent of receipts; the South for 23 percent of establishments and 17.5 percent of receipts; the Midwest for 22.3 percent of establishments and 25.5 percent of receipts and the West for 24.6 percent of establishments and 22.7 percent of receipts.

With respect to type of practice, billings and employees, the Industrial Design Society of America reported that in 1989 of responding groups 56.6 percent were consulting groups accounting for 52.3 percent of design employees; 39.6 percent were corporate design groups accounting for 45.6 percent of design employees and 3.8 percent were other types of groups accounting for 2.2 percent of design employees (Exhibit 14).

Groups reporting billings up to \$249,999 a year accounted for 23 percent of all reporting groups and 6.1 percent of design employees; groups with billings between \$250,000 and \$499,999 accounted for 25.5 percent of groups and 13 percent of employees; groups with billings between \$500,000 to \$999,999 accounted for 23.0

percent of groups and 18.6 percent of employees; Groups with billings of more than \$1 million accounted for 28.5 percent of all groups and 62.3 percent of design employees.

The American Institute of Graphic Art reported that in 1987 free-lancers were 7 percent of its members; 21 percent were self-employed; 28 percent were owners or partners of firms; 44 percent were employees and 1 percent were unemployed.

In 1987 of reporting AIGA members 46 percent were employed in a design firm; 28 percent in a non-design firm; 13 percent in educational institutions; 8 percent in a publishing house; 5 percent in non-profit institutions; 2 percent in governmental institutions and 2 percent in other types of organizations.

## **Income**

Data concerning the income of decorators and designers is available from the Census of Population for 1980 and 1990 and from the two representative associations.

In 1990 decorators and designers working full-time and earning \$7,500 or less accounted for 5.4 percent of all decorators and designers; those earning \$7,500 to \$14,999 in the year before the Census, 14.4 percent; between \$15,000 and \$24,999, 25 percent; between \$25,000 and \$34,999, 22.3 percent; between \$35,000 and \$49,999, 19.4 percent; between \$50,000 and \$69,999, 8.6 percent; between \$70,000 and \$99,999, 3.1 percent and those earning more than \$100,000, 1.9 percent. (Exhibit 15)

The median income for full-time earnings of male decorators and designers was \$32,549 and for females, \$20,394, or 62.7 percent of what their male counterparts earned.

Decorators and designers living in households with an annual income under \$15,000 in 1989 accounted for 7.8 percent of all decorators and designers; those earning between \$15,000 and \$24,999, 11.2 percent; between \$25,000 to \$34,999, 14.8 percent; between \$35,000 and \$49,999, 21.7 percent; between \$50,000 and \$64,999, 17.1 percent; between \$65,000 and \$94,999, 16.2 percent; between \$95,000 and \$124,999, 5.6 percent and those earning more than \$125,000, 5.5 percent.

The median income for male decorators and designers was \$47,688 and for females, \$44,308. Median income for females was 92.9 percent of males. The median household income with a working decorator or designer, either a male or female, was \$45,873.

Median household income of all decorators and designers was 11.3 percent of the experienced civilian labor force; 88.2 percent of professional specialty workers and 10.3 percent of all artists.

## **Conclusion**

A summary of findings concerning architecture and design occupations between 1970 and 1990 appears in the Executive Summary at the beginning of this NEA report on artists and will not be repeated here. Rather, this section will briefly treat

Exhibit 15  
Percentage Distribution of Census Combined Decorators &  
Designers by Full-time Earnings in Year before Census  
1980 & 1990

four aspects of professionalization and competition which affect the employment and earnings in architecture and design professions.

### Professionalization and Competition

Since the Industrial Revolution, the engineer has been at the vanguard of integrating scientific knowledge into the physical structures, instruments and utensils of daily life. With the ascendancy of science, the engineer has displaced the architect as the "master builder." It is rumored that fewer than 10 percent of all construction projects in the U.S. engage architects, with the remaining 90 percent reputedly in the hands of engineers. To some developers architects are too concerned with aesthetics and not enough with function, cost and efficiency.

If architects are considered "soft" compared to engineers, then designers are considered "soft" by architects. Thus while all states and the District of Columbia require formal licensing of architects, only the District licenses and only 14 states regulate use of the term "interior designer." Tension between the two professions was evident in 1990 with passage of the LaValle-Koppell Bill in New York. The bill

resulted from an agreement between the architectural profession and interior designers on the scope of designers' work. In essence the bill: established a legal definition of interior design; established a category of "certified interior designers" and set minimum standards for education, training and testing; distinguished interior decorators from interior designers and defined the type of interior construction designers can perform as "not materially related to or materially affecting the building systems."

Competition and growing demand for interior design has resulted in many architecture firms forming interior design departments.

### **Design Deficit**

With respect to architecture, the U.S. is doing well on world markets. In 1989 there were 200 "design" firms competing for international contracts worth \$7.4 billion. Design firms are those that develop plans for construction projects, as opposed to construction companies. Without differentiating between engineering and architectural firms, the U.S. accounted for 67 (33.5 percent) of competing firms and \$3.2 billion (43.5 percent) of international design work.

With respect to design of consumer products, the situation is quite different, with European imports traditionally dominating the top end of the line in the U.S. Consider the trade balance. In 1982 total U.S. exports were \$252 billion, or 0.8 percent of GNP. Arts-related exports were \$12 billion, or 5 percent of total exports. In 1982 imports amounted to \$306 billion, or almost 10 percent of GNP. Arts imports were \$37 billion, or 12 percent of all imports. Thus the U.S. had a trade deficit with the rest of the world of \$55 billion, or 1.7 percent of GNP. The arts trade deficit was \$25 billion, or 45 percent of the total trade deficit.

Growth in the number of decorators and designers during the 1980s suggests that an effort is being made to fill this trade gap. Good design adds value to products and makes them more competitive in the domestic and export market.

### **Design Rights**

It has been estimated that the U.S. lost more than \$13.5 billion to copyright pirates around the world in 1986 (Hoffman 1989). Unfortunately, there is no estimate of loss due to design piracy.

While European countries and Japan have long provided design protection, the U.S. offers a design patent that requires not just that a design be different and distinctive, but that it be new, useful and not "obvious" to others skilled in the trade.

Product designers consider their work as creative and original as that of painters, sculptors and writers who enjoy copyright protection. Designers, however, too often must watch their work being copied by others with little fear of being sued under existing law (Andrews 1990). To the degree product design protection increases the value of design, then to that degree the employment and earnings of designers will increase and their status in corporate hierarchies would rise.

## Aesthetic Utopians

Frank Lloyd Wright, like members of the German Expressionist Movement, the Bauhaus and the "International Style," believed that architecture and design could change the human condition.

"It was one of those illusions of the 20s," recalls Philip Johnson. "We were thoroughly of the opinion that if you had good architecture the lives of people would be improved...and people (would) improve architecture...This did not prove to be the case." (Hughes 1981:164)

For more than a half century, the International Style of rectangular glass boxes dominated construction in downtown America. Aesthetic utopians wanted buildings and objects to approach an aesthetic ideal of perfection while developers and manufacturers wanted to produce at the lowest possible price, thus fueling the dominance of the style. But in the 1980s architects and designers began to reject this mainstream of modern architecture and design. Not just the formal harmonies and proportions of Gropius, Mies van der Rohe and Le Corbusier were rejected, but also their social and ethical ideals. Functionalism, however, was not rejected.

This stylistic rejection became known as "Postmodernism." It is characterized by an eclecticism of styles and reversion to pre-modern architecture before the International Style.

Without a dominant style, the public is confused while the architecture and design professions search for a new guiding light. A new style fuels the employment and earnings of architects and designers. Perhaps Wright's dream of a distinctive American style will result from this contemporary Postmodern confusion.

## Forecasts

Employment opportunities for architects, landscape architects and designers are projected to rise faster than the average for the labor force as a whole through the year 2005. Most job openings, however, will result from people transferring to other fields or leaving the profession.

Demand for architects and landscape architects depends on local construction which, in turn, is sensitive to the economic cycle. Furthermore, architects must meet licensing requirements in each state before they can practice there, which limits mobility. As well, competition for the most prestigious firms will continue.

Computer-aided design and drafting is becoming more prevalent, but is not expected to reduce demand for architects. Rather, it should allow more options to be developed and changes in plans made more easily, hopefully improving the quality of design.

Landscape architects will no doubt find construction growing in the long term, but mainly outside the major cities. Typically such sites have large surroundings requiring more landscape designing than urban sites. And as the cost of land increases, good landscape design will become more desirable.

Increased development of recreation spaces, wildlife refuges and parks will also require landscape architects, as will growing concern about the environment and

historical preservation. Also, local, city and regional planning is requiring increased mixed land reclamation and refurbishing of existing sites.

Designers should also continue to be in demand. Continued competition and emphasis on product quality and safety, on design of new business and office products, on high-tech products in medicine and transportation will also stimulate demand for industrial designers.

\*\*\*\*\*

To the professional statisticians of the Federal government, the staff of representative organizations and the Research Division of the NEA, whose long term efforts provided the evidence presented in this report, many thanks and encouragement are offered. In a society in which "If you're not counted, you don't count!" their on-going efforts aid and assist materially in making the case for the arts before the court of public opinion.

### About the Author

Harry Hillman Chartrand received his M.A. in Economics (1974) from Carleton University in Ottawa prior to operating his own consultancy, FUTURES. Clients included the Canadian Federation of Mayors and Municipalities, Tri-Level Task Force on Public Finance, Bureau of Intellectual Properties and Secretary of State, Canada Council. From 1981 to 1989, he served as Research Director for the Canada Council. From 1989 to 1994, Mr. Chartrand served as Chief Economist of Kultural Econometrics International. In July he returned to private practice in Saskatoon and now serves as Administrator for the Saskatchewan Arts Alliance. He has written extensively concerning cultural economics.
